1 Introduction

Thank you for purchasing the Bridgeworks WANrockIT Node.

The WANrockIT Node has been designed to ensure that in the majority of installations it will require minimal setup before use. However, we suggest you read the following section which will guide you through setting up your Node.

This Manual contains information for setting up all feature cards that may be installed in your WANrockIT Node. Therefore, some sections may refer to a feature card that may not be installed in your particular Node.

1.1 Overview

Bridgeworks latency mitigating technology allows you to accelerate your network traffic between two different sites. These sites may include data centres and your business centres. Each site will require a WANrockIT Node to accelerate your desired traffic. WANrockIT can only be physical hardware appliances.

The WANrockIT product range supports all major SCSI storage interfaces such as Fibre Channel, iSCSI and SAS.

Each Node's storage interface can be configured to act either as a target interface—working in a similar mode to a storage device, or as an initiator—working in a similar mode to a server. Or, if the WANrockIT Node has multiple storage interfaces, one can be configured to be an initiator and one as a target device.

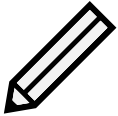

A unique part of WANrockIT functionality is that all the Nodes within a WANrockIT installation do not have to have the same storage interface.

A typical configuration is shown in the image below, where traffic from a server on site A is accelerated over a WAN link to site B.

1.2 Manual Layout

Throughout the manual, symbols will be used to quickly identify different pieces of information.

	This icon represents a note of interest about a step or section of information.
	This icon represents an important piece of information.
	This icon represents a warning. Care must be taken and the warning should be read thoroughly.

1.3 Definitions

Throughout this manual, selected terms will be used to describe pieces of equipment and concepts. This section provides an explanation of those terms.

1.3.1 iSCSI Target Device

iSCSI target devices are devices such as disk drives, tape drives or RAID controllers that are attached to the network. Each device is identified by an IQN (iSCSI Qualified Name).

1.3.2 iSCSI Qualified Name (IQN)

Anything connected to a network, be it a computer, printer or iSCSI device must have a unique identifier, such as an IP address, to enable other devices to communicate with it. With iSCSI devices (both targets and initiators) an extra level of identification in addition to the IP address is employed. This is called the IQN. The IQN includes the iSCSI Target's name and an identifier for the shared iSCSI device.

Example: 2002-12.com.4bridgeworks.sdt600a014d10:5

1.3.3 iSCSI Challenge Handshake Authentication Protocol (CHAP)

CHAP is an authentication scheme used by iSCSI to validate the identity of iSCSI targets and initiators. When CHAP is enabled, the initiator must send the correct username and target password to gain access to the iSCSI target.

Optionally the initiator can request that the target authenticates itself to the initiator; this is called mutual CHAP. If mutual CHAP is selected on the initiator, the iSCSI target will authenticate itself with the initiator using the initiator secret.

1.3.4 Logical Unit Number (LUN)

Each device in a SCSI storage system can support multiple sub-devices; these Logical Units (LU) are indexed by numbers called Logical Unit Numbers (LUN). Within the iSCSI Connect Bridge each SCSI ID on the SCSI bus can support 7 LUNs.

1.3.5 Node

A Node refers to a WANrockIT unit.

1.3.6 Target Device

A device that services storage and management commands, sending responses to those commands. For example disk or tape drives.

1.3.7 Initiator Device

A computer or other piece of equipment, which sends storage and management commands to one or more target devices.

1.3.8 Initiator Port

The port or interface on an initiator device through which commands are transmitted and responses received.

1.3.9 Target Port

The port or interface on a target device through which commands are received and responses transmitted.

2 Using the Web Interface

The primary method for configuring any option is through the web interface. The following section highlights the requirements needed to access the web interface of the Node.

2.1 Browsers

This Node supports the following browsers:

- Microsoft Internet Explorer 11
- Microsoft Edge¹
- Mozilla Firefox¹
- Google Chrome¹

Note: JavaScript must be enabled within the web browser to use the web interface.

Important: If you choose to use a browser that is not in the list of supported browsers, Bridgeworks cannot guarantee the behaviour of the Node's functionality.

2.2 Connecting to the Web Interface

Note:

- DHCP is enabled by default on the management interface.
- The default hostname is `bridgeworks`.
- The default fallback IP address of the management interfaces are:

Management A/Port 1 10.10.10.10

Management B 10.10.10.12

For help locating management interfaces on hardware appliances, please refer to your hardware manual.

If the Node is successfully connected to your DHCP server, and DNS resolution is enabled on your network by default, you can access the Node's web interface from the default hostname by navigating to: <http://bridgeworks/>

¹Latest version as of release

If the Node fails to receive a DHCP address, the web interface can be accessed from the default static IP address by navigating to: <http://10.10.10.10/> or <http://10.10.10.12/>

Important: Your host will likely need to be directly-connected to the Node if DHCP is not enabled, and its subnet set appropriately. See Appendix B: [Accessing the Node from Windows using a static IP Address](#) for help with accessing the Node web interface without DHCP.

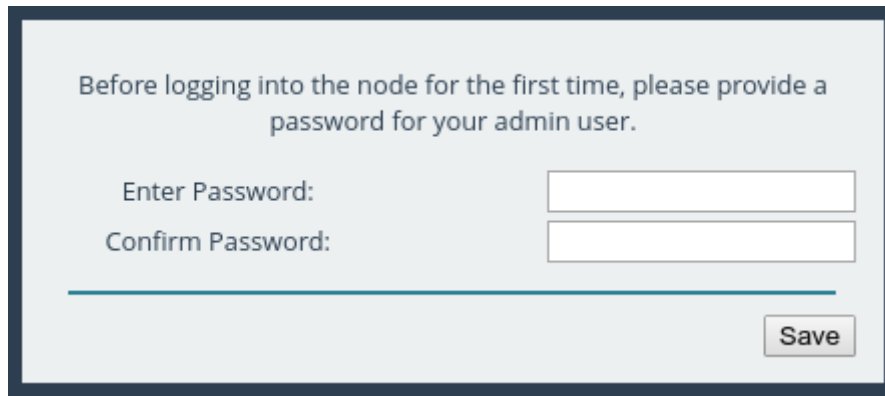

From within your web browser, connect to the Node's web interface using default hostname or IP address of a connected management interface.

Once you have connected to the web interface on the Node you will be provided with the Bridgeworks End User License Agreement (EULA) which must be accepted before you are able to access the Node. Ensure you read this agreement thoroughly. To proceed, you must accept the agreement by clicking the *Accept* button.

Important: If you accepted the Bridgeworks EULA during the deployment of your Node, you will not need to accept it again.

You will then see the entry page shown below:

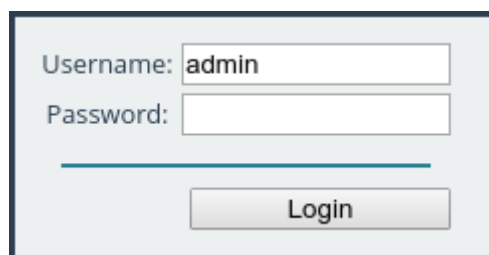

Before logging into the node for the first time, please provide a password for your admin user.

Enter Password:

Confirm Password:

Enter and confirm the new web interface password to be presented with the login screen. The password must be between 5 and 64 characters and should contain both symbols and numbers.

Username:

Password:

To access the web interface a username and password must be used. The default username is *admin*.

2.3 Management Console (Home screen)

The web interface will now display the Console Home screen as shown below:

Note: The web interface may have different icons to the ones shown above depending on the configuration you have purchased.

The web interface is split into two sections. The left hand *Node Menu* panel typically remains constant wherever you are within the web interface. It allows you to reboot or logout of the web interface. The Home link may be used from any page to return to the Home screen.

Note: Whenever a Reboot command is issued, it may take several minutes for the Node to become accessible again.

The Support link will open up a new tab in your browser at the Bridgeworks website support page.

The Help will provide you with information relevant to the display and configuration data.

3 Node Configuration

This section details the configuration of the Node's basic network and service settings.

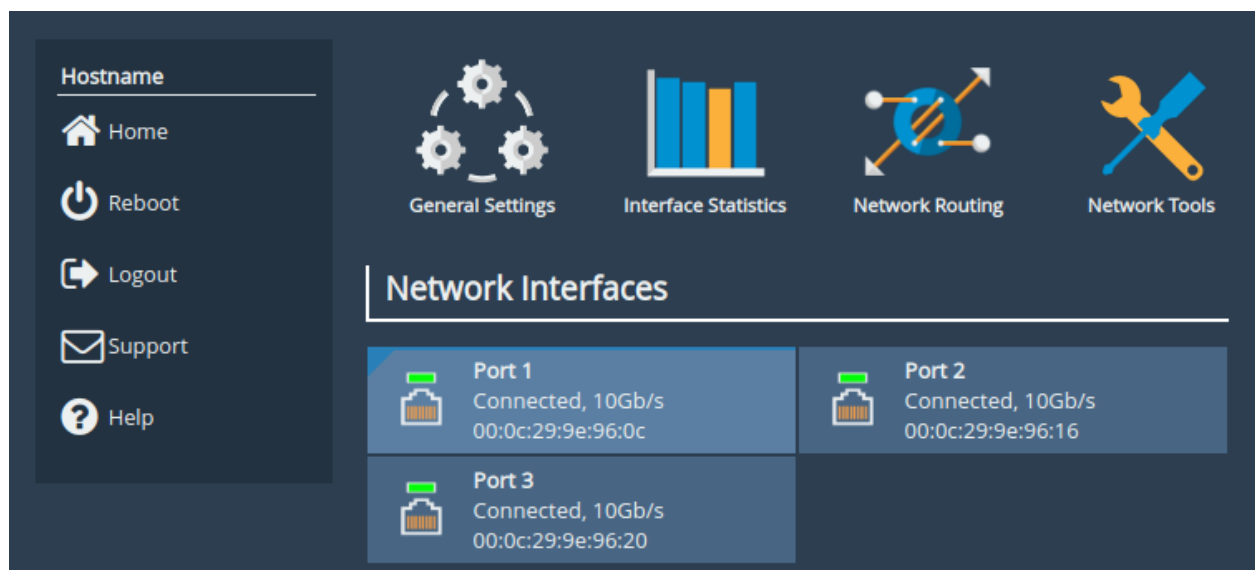

3.1 Network Connections

This configuration page allows the administrator to configure network interface settings and view network statistics.

From the Home screen, select the *Network Connections* icon under the *Node Configuration* section.

The web interface will display the following:

Options at the top of the page allow you to access various network settings and tools. More information for these options can be found in the following sections:

- Section [3.1.2: General Settings](#)
- Section [3.1.3: Interface Statistics](#)
- Section [3.1.4: Network Routing](#)
- Section [3.1.5: Network Tools](#)

3.1.1 Network Interfaces

This section displays each network port present on the Node, along with its current status/link speed, and hardware identifier (MAC address).

Clicking on a particular interface will navigate to a bespoke configuration page for that particular interface. More information on the different interface settings is available in [Section 3.1.6: Port Settings](#).

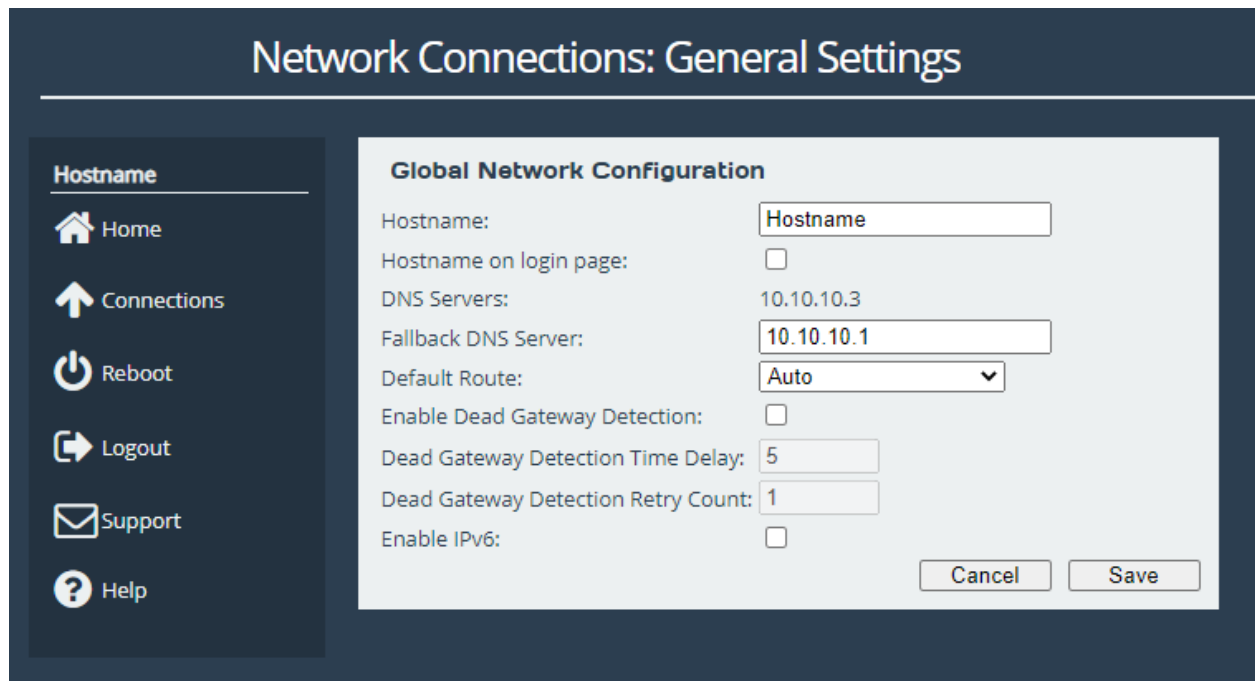

3.1.2 General Settings

This configuration page allows the administrator to configure general network settings for the Node.

From the *Network Connections* page, select the *General Settings* icon.

When selected, you will be presented with the following screen.

A screenshot of the "Network Connections: General Settings" web interface. The interface has a dark blue header with the title "Network Connections: General Settings". On the left is a sidebar with a "Hostname" section and a list of navigation items: Home (house icon), Connections (upward arrow icon), Reboot (power icon), Logout (logout icon), Support (envelope icon), and Help (question mark icon). The main content area is titled "Global Network Configuration" and contains several settings: "Hostname:" with a text input field containing "Hostname"; "Hostname on login page:" with an unchecked checkbox; "DNS Servers:" with a text input field containing "10.10.10.3"; "Fallback DNS Server:" with a text input field containing "10.10.10.1"; "Default Route:" with a dropdown menu showing "Auto"; "Enable Dead Gateway Detection:" with an unchecked checkbox; "Dead Gateway Detection Time Delay:" with a text input field containing "5"; "Dead Gateway Detection Retry Count:" with a text input field containing "1"; and "Enable IPv6:" with an unchecked checkbox. At the bottom right of the settings area are "Cancel" and "Save" buttons.

3.1.2.1 Hostname

In the *Hostname* field, enter the name you wish to use to address this Node. It is a good idea to make the name relevant to the Node's location and/or purpose.

You can then access the web interface from this hostname in future, from any DHCP-enabled management interface.

3.1.2.2 Hostname on login page

When enabled, the Node's hostname will be displayed on the login screen before logging in.

3.1.2.3 DNS Servers

Setting a DNS server enables the use of DNS names when configuring network services.

The *DNS Servers* field lists the DNS servers that are currently in use by the Node. If DHCP is enabled on an interface and returns DNS servers, then these will be displayed in the list, otherwise the *Fallback DNS Server* will be used.

3.1.2.4 Default Route

The *Default Route* is the interface that the Node will use to route packets when no specific interface has been specified.

Important: The selected interface must have a gateway configured for this to take effect.

In addition to being able to select a specific interface for the *Default Route* it is also possible to select the interface automatically with the *Auto* option. In this case an interface which has both *Management* mapped to it and a default gateway configured will be set as the default route. This operation is performed at startup only.

If the user requires no *Default Route* it is possible to set *None*. Factory default value for this setting is *Auto*.

3.1.2.5 Dead Gateway Detection

Selecting the *Enable Dead Gateway Detection* checkbox will allow the Node to detect dead gateways and remove network routes that specify those gateways. When the dead gateways are reachable again, the routes are restored. This provides a level of failover in the event that the gateways become unreachable.

Dead Gateway Detection Time Delay refers to the time in seconds between requests being sent to the gateway to see whether that gateway is still reachable.

Dead Gateway Detection Retry Count refers to the number of times an unreachable gateway will be contacted before being set as a dead gateway and removed.

The status of each gateway is displayed on the *Routing* page. Refer to Section [3.1.4: Network Routing](#) for information on viewing and modifying network routes. An icon next to each gateway indicates its state:

Live Gateway Represents a gateway that responds to ICMP echo

Dead Gateway Represents a gateway that no longer responds to ICMP echo requests; it is dead

Important: Dead gateway detection functions by sending periodic ICMP echo requests to each gateway. Please ensure that the gateways can respond to such requests; if they're blocked by a firewall, dead gateway detection will always consider the gateways to be dead.

Help

Default routes should not be added here

Routing Tables

Destination	Gateway		Interface	Metric	
0.0.0.0/0	10.10.10.1	✓	Port 1	1	🔒
10.10.0.0/16			Port 1	1	🔒
192.168.1.0/24			Port 2	1	
192.168.2.0/24	192.168.1.1	✗	Port 2	1	
192.168.2.0/24	192.168.1.100	✓	Port 2	2	

Delete route

Add Static Route

Interface:

Port 1 ▾

Destination:

192.168.2.0

Prefix:

/24

Gateway:

192.168.1.100

Metric:

2

Add route

In this example, dead gateway detection has been enabled and multiple redundant routes to 192.168.2.0/24 have been added with different gateways (192.168.1.1 and 192.168.1.100) and different metrics (1 and 2, respectively).

The gateway with the IP address of 192.168.1.1 isn't responding to ICMP echo requests, so it's deemed to be dead. The corresponding route has been removed, so any traffic to 192.168.2.0/24 will now go via 192.168.1.100 instead.

When the gateway with the IP address of 192.168.1.1 starts to respond to ICMP echo requests again, the icon next to it will change from the red cross to the green tick and its route will be restored. Any traffic to 192.168.2.0/24 will go via 192.168.1.1.

3.1.2.6 Enable IPv6

Selecting the *Enable IPv6* checkbox will enable the Node to use IPv6 addresses. As with IPv4, you can either choose automatic address assignment or assign a static IPv6 address.

3.1.3 Interface Statistics

This page displays live network interface data rate statistics.

From the *Network Connections* page, select the *Interface Statistics* icon.

When selected, you will be presented with the following screen.

3.1.3.1 Data Transmission Rate

This section displays a graph, representing the data transmission rate for each network interface over the last 90 seconds. Each interface is displayed using a unique colour specified in the *Legend*. The average transmission rate over the last 90 seconds is displayed by a horizontal line for each interface.

3.1.3.2 Data Reception Rate

This section displays a graph, representing the data reception rate for each network interface over the last 90 seconds. Each interface is displayed using a unique colour specified in the *Legend*. The

average reception rate over the last 90 seconds is displayed by a horizontal line for each interface.

3.1.3.3 Legend

Each base network interface will be displayed using a unique colour for the data rate graphs. Each interfaces colour will be displayed alongside the ports name here.

3.1.4 Network Routing

This configuration page allows the administrator to view the network routes currently active on the Node. Routes can also be added or removed on this page.

From the *Network Connections* page, select the *Network Routing* icon.

3.1.4.1 Add Static Route

To add a route, fill in the following fields and click on the *Add route* button:

Interface The network interface to which the route applies.

Destination The IP address component of the CIDR block to which the route applies, e.g. 192.168.5.0.

Prefix The prefix length component of the CIDR block to which the route applies, e.g. /24.

Gateway Route traffic via the gateway with this IP address. Optional.

Metric Metric (priority) of the route. Optional; defaults to 1.

Add route

In this example, a route is being added to 192.168.5.0/24 via the gateway at 192.168.2.4 on Port 2. The route has a metric of 3.

To remove an existing route, click on the *Delete* button next to it.

Important: Routes created automatically by the system cannot be removed.

When dead gateway detection is enabled, each gateway in the table will have an icon next to it indicating its current status (live or dead). Refer to Section 3.1.2.5: [Dead Gateway Detection](#) for more information.

3.1.5 Network Tools

The WANrockIT product provides some network tools that can be used for verifying network connectivity and behaviour between the Node and network hosts.

From the *Network Connections* page, select the *Network Tools* icon.

When selected, you will be presented with the following screen.

Output

3.1.5.1 Ping

Ping can be used to verify the connectivity between the Node and a network host.

To test connectivity, fill in the following fields and click on the *Ping* button:

23

Host The IP address of the network host.

Payload Size The ping payload size. Leave blank to default to 56 bytes.

Count The number of ping attempts that you wish the Node to perform. Setting the count to 0 will send pings indefinitely, until the page is navigated away from, or another ping/traceroute operation is initiated.

Network Interface The interface that you want to ping from. If you are checking the routing on the unit, leave this option set to

On a successful ping, the *Output* box will fill with text similar to that below.

```
PING Address (Address): 56 data bytes
64 bytes from Address: seq=0 ttl=64 time=0.600 ms
64 bytes from Address: seq=1 ttl=64 time=0.129 ms
64 bytes from Address: seq=2 ttl=64 time=0.096 ms
64 bytes from Address: seq=3 ttl=64 time=0.143 ms
64 bytes from Address: seq=4 ttl=64 time=0.094 ms

--- Address ping statistics ---
5 packets transmitted, 5 packets received, 0% packet loss
round-trip min/avg/max = 0.094/0.212/0.600 ms
```

Note: *Address* is replaced with the IP address that you entered.

3.1.5.2 Traceroute

Traceroute can be used to determine the route packets take from the Node to a network host.

To test the routing, fill in the following fields and click on the *Traceroute* button:

Host The IP address of the network host.

Packet Size The traceroute payload size. Leave blank to default to 46 bytes for IPv4 or 72 bytes for IPv6.

Set Don't Fragment Bit Select to set the don't fragment (DF) bit on the traceroute packets. This can be used to diagnose MTU issues on your network.

Use ICMP Echo Select to use ICMP echo requests instead of UDP datagrams. This can be useful when your firewall blocks UDP traffic.

Network Interface The interface that traceroute packets will be sent from. Leave as *Default selection* for the interface to be selected according to the routing table.

The result from traceroute will appear in the *Output* box.

3.1.6 Port Settings

Clicking on an interface will navigate to a bespoke settings page for that particular interface. Depending on the type of interface that was selected and the current options that are enabled, different settings will be presented.

The screenshot shows a web-based network management interface. On the left is a dark sidebar with a 'Hostname' header and a list of navigation items: Home (house icon), Connections (upward arrow icon), Reboot (power icon), Logout (right arrow icon), Support (envelope icon), and Help (question mark icon). The main content area has a dark header with 'Link Status' and 'Settings' sections. The 'Link Status' section displays: Link State: Up, Link Speed: 1000Mb/s, RX Bytes: 404957, TX Bytes: 1163244, RX Errors: 0, and TX Errors: 0. The 'Settings' section displays: IPv4 Address: 10.10.120.137 and MTU: 1500. Below this is a 'Mapped Protocols' section with a 'Management' button. The 'Port Settings' section is highlighted and contains: 'Enable Port:' with a checked checkbox, 'MTU Size:' with a text input field containing '1500', and two radio button options: 'Use DHCP to assign an IP address automatically' (selected) and 'Use the following IP address:'. Below the radio buttons are three text input fields for 'IP Address:' (10.10.120.137), 'Netmask:' (255.255.0.0), and 'Gateway:' (10.10.10.1). At the bottom right of the main content area are 'Cancel' and 'Save' buttons.

Important: IPv6 Options will only be displayed if IPv6 has been enabled (see Section 3.1.2: [General Settings](#)).

3.1.6.1 Enable Port

An interface may be enabled or disabled by toggling this option.

3.1.6.2 Setting the MTU

The maximum transmission unit (MTU) may be adjusted from the default of 1500 bytes. Lower values are sometimes required for best performance with some types of network VPN equipment. However it is recommended to leave this value unchanged, unless advised by documentation for any external VPN equipment used in conjunction with the Node.

Enabling larger frames on a jumbo frame-capable network can improve your network throughput.

Jumbo frames are Ethernet frames that contain more than 1500 bytes of payload (MTU).

Before enabling jumbo frames, ensure that all the devices/hosts located on the network support the jumbo frame size that you intend to use to communicate with the Node. If you experience network-related problems while using jumbo frames, use a smaller jumbo frame size. Consult your networking equipment documentation for additional instructions.

Important: Some networking switches require you to specify the size of the jumbo frame (MTU) when enabling, as opposed to a simple enable command. On these switches it might be required to add the necessary bytes needed for the frame header to the MTU size you specify in the Node's port configuration. Typical header size is 28 bytes, so a 9000 byte MTU could translate to a 9028-byte total size. Refer to your switch documentation to understand what the maximum frame size settings are for your switch.

3.1.6.3 Setting the IP Address

There are two possibilities when configuring the IP address of a network port:

DHCP The Node will seek out your network's DHCP server and obtain an IP address for this port each time it boots.

If the server is not found, this port will fall back to its saved static IP settings.

Static IP The IP address, netmask and gateway set in the corresponding fields will be used for this port.

The gateway field may be left blank.

The IPv4 netmask field must be specified in dot-decimal form, e.g. 255.255.255.0.

If IPv6 is enabled from the *Network Connections* page, you can choose to use automatic address assignment to assign an IPv6 address, or you can set a static IPv6 address.

Note: DHCP is enabled by default on management interfaces.

Note: If DHCP is enabled, we recommend that your DHCP server is set to automatically update the DNS server.

3.1.6.4 Committing the Changes

Click the **Save** button to save these parameters, then reboot the Node to apply them.

3.2 Passwords & Security

This configuration page allows the administrator to change the security settings of the Node.

From the Home screen, select the *Passwords & Security* icon under the *Node Configuration* section.

The web interface will display the following:

Passwords & Security

Hostname

Home

Reboot

Logout

3.2.1 System Password

This section allows the administrator to change the access password for the web interface. The new password must be between 5 and 64 characters and should contain both symbols and numbers.

Important: The word “RESET” is reserved by the system and cannot be used as a password.

Enter the existing password into the *Old Password* field; then enter the desired new password into the two following fields. Then click *Change Password*.

3.2.2 Password Reset Options

This section allows the administrator to enable and disabled different methods of password reset on the Node.

3.2.2.1 Password Reset via Email

3.2.2.1.1 Setup

This method of password reset allows a user that is authorised to access a pre-configured email address to reset the password of any user account on the Node.

When a user forgets their password, they will be able to click on the *Forgot your password?* link on the login page to reset their password.

To successfully reset your password using this method, an confirmation code will be sent to an email address previously configured in the web interface. This code will have to be obtained by the user and entered in to the password reset wizard to complete the password reset procedure.

Important: Resetting a password will log out any current sessions under that user name.

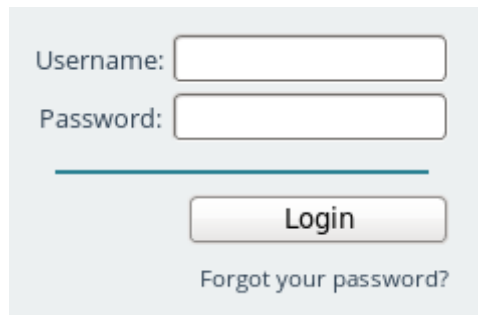

To enable password reset via email, SMTP settings will have to be configured first to allow the Node to send emails. Navigate to the *Service Control* page and enter your SMTP settings under the *Simple Mail Transfer Protocol (SMTP)* section. Refer to Section [3.3.3: Email](#) for information on SMTP configuration.

Next, navigate to the *Passwords & Security* page and tick the *Enable password reset via email* checkbox. You must then select whether you wish to have the confirmation code sent to the “event notification email” which is configured on the *Service Control* page, or to an alternative email which can be entered in the text box underneath.

Refer to Section [3.3.4: Event Notification Email](#) for information on setting an event notification email. You will be required to enter an email address in to the *alternative email* text box if an event notification email has not been set.

3.2.2.1.2 Using Password Reset via Email

To reset the password of a user account using the email method, navigate to the login page of the Node you wish to reset the password for. If password reset via email is enabled, there will be a “Forgot your password?” link underneath the login button as shown:

Username:

Password:

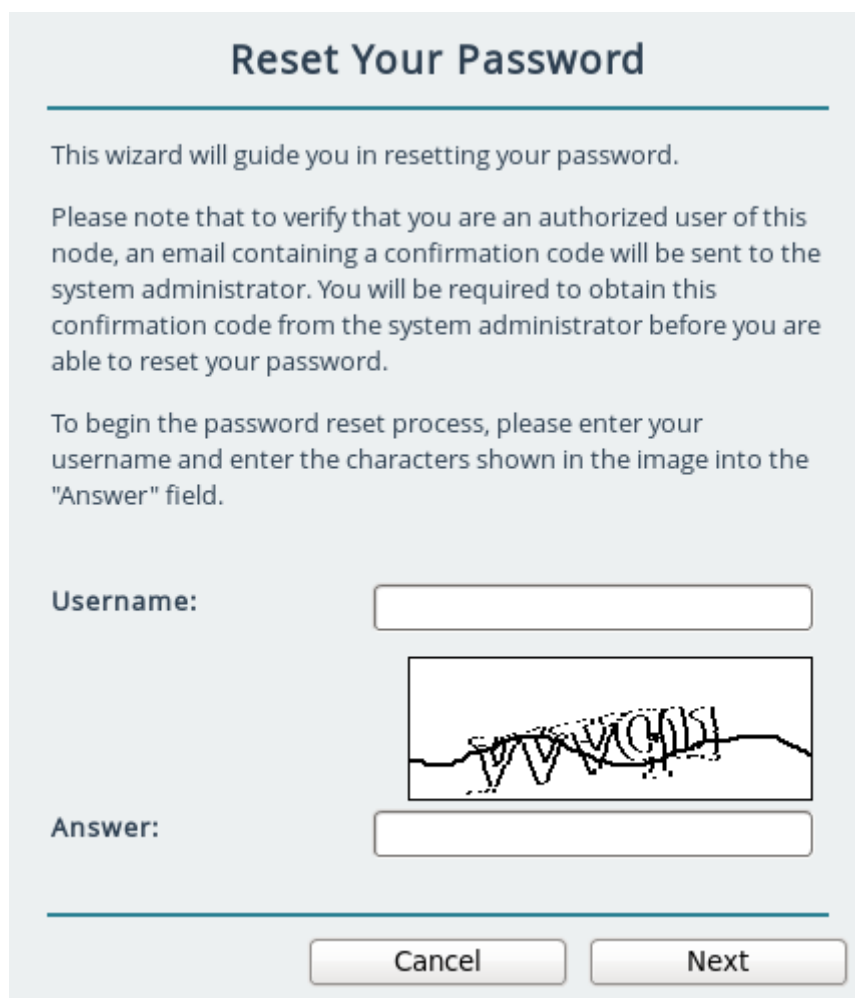

[Login](#)

[Forgot your password?](#)

Important: If the “Forgot your password?” link is not present, then password reset via email has not been enabled on the Node.

Enter the username you wish to reset the password for and complete the captcha challenge by entering the characters in the image in to the *Answer* text box. Then click *Next* to continue.

Reset Your Password

This wizard will guide you in resetting your password.

Please note that to verify that you are an authorized user of this node, an email containing a confirmation code will be sent to the system administrator. You will be required to obtain this confirmation code from the system administrator before you are able to reset your password.

To begin the password reset process, please enter your username and enter the characters shown in the image into the “Answer” field.

Username:

Answer:

[Cancel](#) [Next](#)

Important: You can try a different captcha challenge by refreshing the web page.

An email containing a confirmation code will be sent to the email address set in the *Passwords & Security* page. Enter the confirmation code sent in the email to the *Confirmation Code* text box.

Enter your new password in to the *New Password* and *Confirm Password* text fields and press the *Next* button.

Reset Your Password

An email containing a 16-digit confirmation code has been sent to the system administrator of this Node.

Enter the confirmation code and your new password below.
Please note that you will not be able to reset your password if the confirmation code is incorrect.

Confirmation Code:

New Password:

Confirm Password:

If password reset was successful, a message will be displayed and you will be able to log in with your new password.

Password reset was successful.
Please login with your new password.

Username:

Password:

[Forgot your password?](#)

3.2.2.2 Password Reset via Local Console or SSH

3.2.2.2.1 Setup

These methods of password reset allow any user that either has access to the local console or remote access via SSH to reset the password of any user account on the Node.

Warning: These methods of password reset should be disabled if unauthorised users may either have access to the local console or remote access via SSH.

Important: Resetting a password will log out any current sessions under that user name.

To enable password reset via local console, tick the *Enable password reset via the local console* checkbox or to enable via SSH, tick the *Enable password reset via SSH* checkbox. Then click **Save**.

Important: Password reset via local console is enabled by default.

3.2.2.2.2 Using Password Reset via Local Console or SSH

To reset the password of a user account using the local console method, connect a keyboard and monitor to the Node. You will see the following screen:

Press the “Alt” and “F2” keys at the same time to get access to the login prompt as shown:

To reset the password of a user account using the SSH method, connect to the Node via SSH to access the login prompt.

Enter the username you wish to reset the password for, such as “admin”. Then enter the password as “RESET”. Both the username and password are case-sensitive.

You will then be asked whether you wish to continue resetting the password. Press the “y” key then press the “Enter” key. Entering any other key will abort the password reset process.

```
Bridgeworks Management Interface
Username: admin
Password:
Are you sure you want to reset your password? y/n
_
```

Next, enter the new password you wish to set for the user selected. You will then be asked to enter the password again.

Important: If the two passwords do not match, or you are attempting to set the password as “RESET”, then password reset will fail.

If your new password is accepted, the “Password set successfully” message will appear as shown:

```
Password set successfully
Bridgeworks Management Interface
Username: _
```

You will now be able to log in to the web interface using your username and new password.

3.2.3 Secure Connection

To enable HTTPS, select the *Use an encrypted web connection* radio button, and click Save.

☐ Use a standard web connection

☒ Use an encrypted web connection (HTTPS):

Upload Certificate: No file selected.

Optional Separate Key: No file selected.

If you simply click Save without uploading any files for the certificate or key, a self-signed certificate will be automatically generated by the Node.

Alternatively, You can use your own certificate & key pair by selecting files to upload with the file-picker buttons. You may upload the key pair as two separate files, or one combined file.

You will be logged out of the Node's web interface, and further transactions with the web interface will use SSL/TLS encryption.

3.2.4 Session Timeout

After not interacting with the interface for a certain period of time, you will automatically be logged out. The Session Timeout setting allows you to adjust the length of time that must pass before you are logged out.

3.2.5 Secure Shell (SSH)

Secure Shell (SSH) is a protocol that allows for secure access to a Node's configuration console.

To enable SSH on network interfaces with the "Management" protocol mapped, tick the *Enable SSH* checkbox and click *Save*.

Note: At least one public key must uploaded, as described below, before SSH can be enabled.

3.2.5.1 Managing Public Keys

To log on to a Node's configuration console using SSH, a public key is required to be uploaded first. Users connecting to the Node without having uploaded the corresponding public key to the Node first will be refused access.

To upload a public key, click on the *Add Public Key* button. The *Add Public Key* dialog box will appear. Click on the *Browse* button to select a public key file.

Note: Only RSA keys in the OpenSSH or RFC4716 format are supported.

Click on the *Add* button to upload the selected public key file. The public key should then appear in the *List of Public Keys*.

To delete a public key, click on the public key to delete in the *List of Public Keys* and then click on the *Remove Public Key* button.

Important: Open SSH connections will not be closed when a public key is removed, or if SSH is disabled. Only new SSH connections will be rejected.

3.2.5.2 Using SSH

To connect to a Node which has a management port with an IP address of 192.168.0.20 using the OpenSSH SSH client, use the command:

```
ssh admin@192.168.0.20
```

You will then be prompted for the username and password of the Node to log in to the configuration console.

You will be denied entry to the configuration console if you have not uploaded a public key to the Node prior to connecting via SSH. A valid username and password for the Node is also required to log in using SSH.

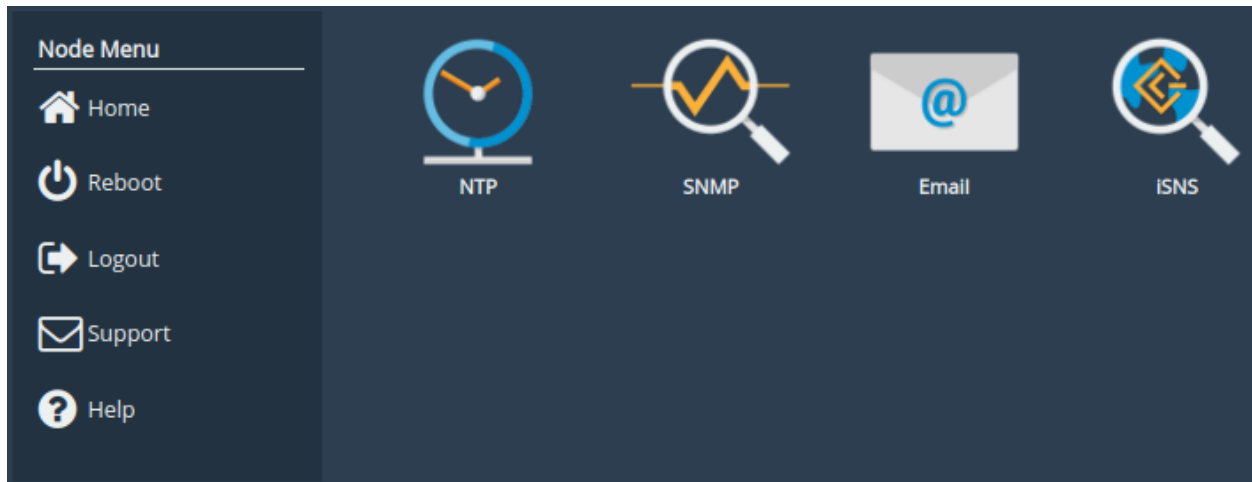

Important: Logging in as root user is disabled on SSH.

3.3 Service Control

This configuration page allows the administrator to configure network services for the Node. From the Home screen, select the *Service Control* icon under the *Node Configuration* section.

The web interface will display the following:

Each link leads to a different service.

The *NTP* (Network Time Protocol) page allows you to configure various settings available for NTP on the Node.

The *SNMP* (Simple Network Management Protocol) page allows you to configure various settings available for SNMP on the Node.

The *Email* page allows you to configure various settings available for Email alerts on the Node.

The *iSNS* page allows you to configure various settings available for iSNS on the Node.

3.3.1 Network Time Protocol (NTP)

The image shows a configuration window titled 'Simple Network Time Protocol (SNTP)'. It contains a checkbox labeled 'Enable SNTP:' which is checked. Below it is a text input field labeled 'NTP Server:' containing the IP address '10.0.80.2'. At the bottom of the window, there is a note: 'Time synchronization between the host machine and the guest VM is only enabled when NTP is disabled.' and a 'Save' button.

SNTP is a protocol for synchronising the clock of computer systems. This feature is critical if you are planning on using the scheduler or useful when viewing the logs to determine when an event occurred. Refer to Section [13.2: System Log](#) for more information.

To enable SNTP, select the *Enable SNTP* checkbox and enter the IP address for the NTP server. Then click *Save*.

3.3.2 Simple Network Management Protocol (SNMP)

☐ **SNMP v2c Agent**
Community Name:

☐ **SNMP v3 Agent**
Username:
Auth Type:
Auth Password:
Privacy Type:
Privacy Password:

System Information
System Location:
System Contact:

SNMP Trap Sinks

Address	Port	Version	Community/User
No SNMP trap sinks configured			

Download MIB Files

Two versions of SNMP are supported, 2c and 3. V3 is recommended as it has everything 2c has plus vastly superior security.

To enable SNMPv2c, check the box in the top left of the *SNMP v2c Agent* box, enter a *Community Name* and click *Save*.

To enable SNMPv3, check the box in the top left of the *SNMP v3 Agent* box, then enter a *Username*. Authentication verifies the sender of data while privacy protects the data. *SHA1* and *AES-128* are the superior and recommended hash function and encryption protocol respectively. Once done configuring the security settings, click *Save*.

3.3.2.1 System Information

The information configured here is accessible over SNMP.

System Location is the location of this Node. The value of this property should provide enough information for an administrator to locate this Node.

System Contact is the contact information for the person or department responsible for managing this Node. Click *Save* to save changes to System Information.

3.3.2.2 SNMP Trap Sinks

The Node notifies all configured *Trap Sinks* when a system event occurs. This means your SNMP manager can be notified should the Node encounter an error.

Click *More Info* link to view more information about a specific sink.

To add a new sink, click the *Add Sink* button to open the Add SNMP Trap Sink dialog.

3.3.2.3 Add SNMP Trap Sink

Address is the IP Address of the trap sink. Must be a valid IP address. Reserved and multicast addresses are not supported.

Port is the port of the trap sink.

Version is the version of SNMP the sink uses. It is recommended to use SNMPv3 where possible since it allows for authentication and privacy. The following versions are supported:

- v1: SNMPv1 (not recommended)
- v2c: SNMPv2c allows acknowledged traps
- v3: SNMPv3 allows privacy and authentication, making it more secure than SNMPv1 and SNMPv2c. (recommended)

Type is the type of notification sent to the trap sink. It is recommended to use the *Inform* notification type since it is acknowledged and therefore the notification is less likely to be unintentionally lost.

- Trap: Unacknowledged message
- Inform: Acknowledged message, not supported with SNMPv1

Community is the community string to use for the trap sink. Supported in SNMPv1 and SNMPv2c. Cannot contain spaces.

Username is the SNMPv3 unique identifier to associate these security details with. Must be 1-32 characters in length, and cannot contain spaces.

Engine ID is the SNMPv3 Engine ID of the trap sink. The Node should automatically discover the engine ID if this is left blank. If an Engine ID is provided, it must be 5-32 characters in length, and cannot contain spaces.

Authentication is the SNMPv3 authentication hash function used by the trap sink. Authentication allows only SNMP engines with the correct authentication password to connect to the trap sink. It is recommended to use authentication where available. It is not recommended to use the MD5 hash function since it suffers from vulnerabilities.

- SHA1: Uses the SHA1 hash function (recommended)
- MD5: Uses the MD5 hash function (not recommended)
- None: Authentication Disabled (not recommended)

Auth Password is the authentication password used to log in to the trap sink. An authentication password must be provided if *Authentication* is not set to *None*.

Privacy is the SNMPv3 privacy type used by the trap sink. *Authentication* must be enabled to use privacy. Privacy allows SNMP engines to communicate privately using encrypted messages. It is recommended to use privacy where available. It is not recommended to use the DES cipher function since it is cryptographically weak.

- AES-128: Uses the AES-128 cipher function (recommended)
- DES: Uses the DES cipher function (not recommended)
- None: Privacy Disabled (not recommended)

Privacy Password is the privacy password used to communicate privately with the trap sink. A privacy password must be provided if *Privacy* is not set to *None*. If the sink has privacy enabled but doesn't have a specific privacy password, then the privacy password is likely the same as the authentication password.

3.3.2.4 Download MIB Files

Several Management Information Bases (MIBs) are available for querying on this unit using SNMP and these MIBs can be accessed using unique Object Identifiers (OIDs).

MIB	OID
System	1.3.6.1.2.1.1
Interfaces	1.3.6.1.2.1.2
IP	1.3.6.1.2.1.4
ICMP	1.3.6.1.2.1.5
TCP	1.3.6.1.2.1.6
UDP	1.3.6.1.2.1.7
Bridgeworks Node Management Statistics	1.3.6.1.4.1.49599.11
Bridgeworks Service Statistics	1.3.6.1.4.1.49599.12

The MIBs describing data within the Bridgeworks' OID can be downloaded by clicking *Click Here to Download*. A MIB file can be imported in to an SNMP manager in order to provide useful information about data returned by the SNMP agent or sent in an SNMP trap.

3.3.3 Email

Simple Mail Transfer Protocol (SMTP)

SMTP Server:

SMTP Server Port:

Sender Email Address:

SMTP Username:

SMTP Password:

Save

Event Notification Email

Enable Email Alerts: ☐

Recipient Email Address:

System Event Level:

System Log Level:

Test Save

This section allows an SMTP server to be configured, to send emails on behalf of the Node.

The fields in this subsection are:

SMTP Server To enable an SMTP server, enter its IP address or hostname in this field.

The server must be reachable from the Node's Management interface (or whichever port the default route is set to) on this address. Refer to Section 3.1.2.4: [Default Route](#) for information on setting the default route.

SMTP Server Port Enter the port number of the SMTP server. If no port number is specified, it will use the default port (25).

Sender Email Address The address from which emails will be sent. This needn't be a previously in-use address; it can be anything your SMTP server will allow. This can be used to identify the emails from this Node.

Must be of the form: @.

SMTP Username Username credential to be used to send emails from the SMTP server. May be blank, depending on your server's configuration.

SMTP Password Password credential to be used to send emails from the SMTP server. May be blank, depending on your server's configuration.

Click **Save** to apply any changes made to the SMTP configuration.

3.3.4 Event Notification Email

The Node can notify a systems administrator when events of a certain urgency occur in the Node log. Before this can be done, SMTP settings must be configured. Refer to Section 3.3.3: [Email](#) for information on SMTP settings.

To enable email alerts on the Node, select the *Enable Email Alerts* checkbox. The two following fields should then be completed:

Recipient Email Address The email address/addresses to which the emails will be sent. Multiple email addresses can be specified, separated by a semicolon, e.g.:
office@example.com; home@example.com.

Trigger Event Log Level The minimum log level to trigger an email. Events of higher urgency than the selected level will also trigger an email. The available levels are, in descending order of urgency:

Critical Example: The Node is running at non-recommended temperatures.

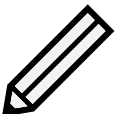

Error Example: A device attached to the Node has been disconnected.

Warning Example: An invalid configuration file was uploaded.

Confirm these settings by clicking **Save**.

The *Test* button will send a test email to the recipient email address/addresses to confirm that the email configuration is working correctly.

3.3.5 Internet Storage Name Service (iSNS)

	Note: iSNS is only available if your WANrockIT Node has an iSCSI target feature card installed.
---	---

Internet Storage Name Service (iSNS)
Enable iSNS: ☐
iSNS Server:
Save

Internet Storage Name Service allows automated discovery, management and configuration of iSCSI resources from a central point. With this option enabled, the Node's iSCSI target will be registered with an iSNS server, from which it can be discovered.

To enable this feature, select *Enable iSNS*, and enter the IP address or hostname of the iSNS server with which to register in the *iSNS Server* field. Then click **Save** to apply changes.

4 WANrockIT Configuration

The *WANrockIT* section of the web interface allows the administrator to configure different aspects of the WANrockIT Node.

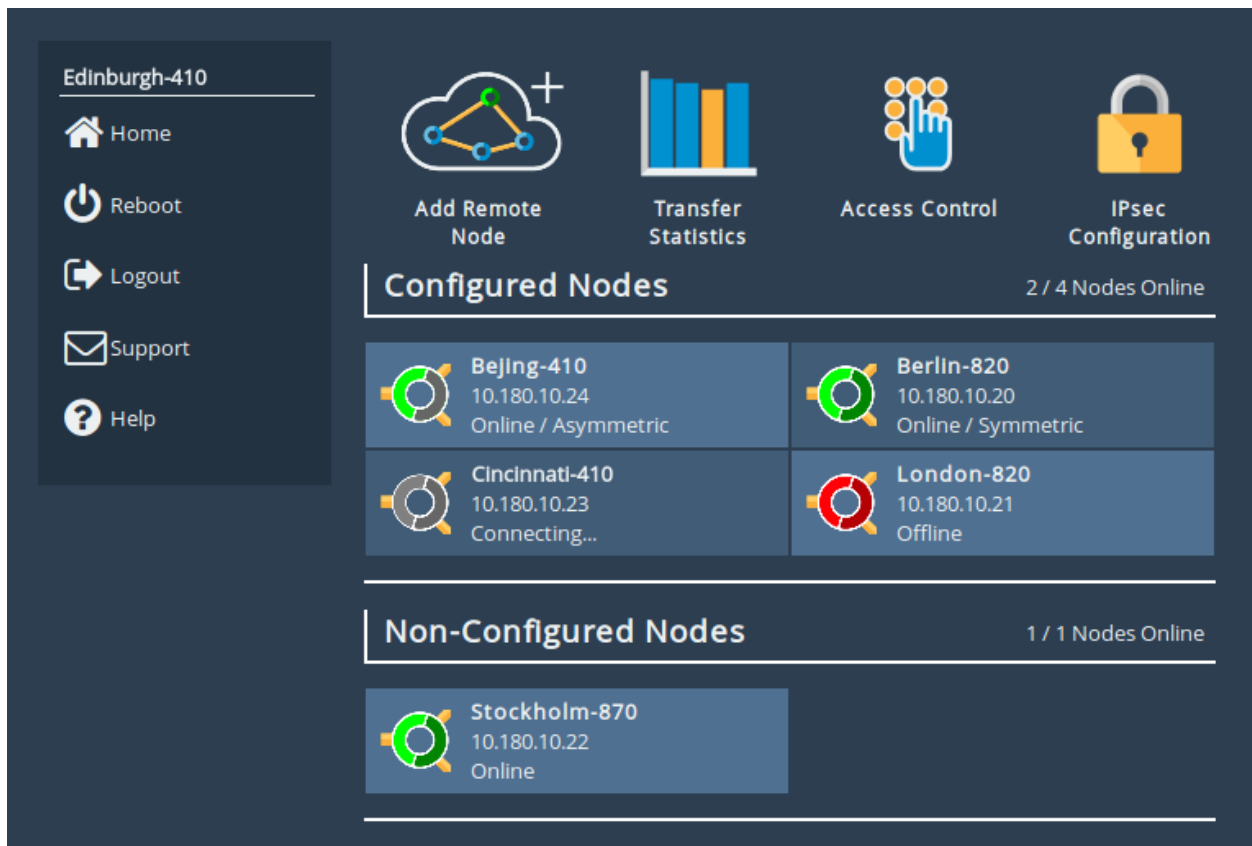

4.1 Node Management

The *Node Management* page has all the tools necessary to connect to remote Nodes, set security options, view transfer statistics and configure your linked Nodes.

From the Home screen, select the *Node Management* icon under the *WANrockIT* section.

The web interface will now display the following:

Configured Nodes		2 / 4 Nodes Online	
	Beijing-410 10.180.10.24 Online / Asymmetric		Berlin-820 10.180.10.20 Online / Symmetric
	Cincinnati-410 10.180.10.23 Connecting...		

Non-Configured Nodes		1 / 1 Nodes Online
	Stockholm-870 10.180.10.22 Online	

Options at the top of the page allow you to configure settings for your current Node. More information for these options can be found in the following sections:

- Section [4.1.2: Add Remote Node](#)
- Section [4.1.3: Transfer Statistics](#)
- Section [4.1.4: Access Control](#)
- Section [4.1.5: IPsec](#)

4.1.1 Remote Nodes

This section details the Nodes that have been configured with your appliance.

The screenshot displays a web interface for managing remote nodes. It is divided into two main sections: 'Configured Nodes' and 'Non-Configured Nodes'. The 'Configured Nodes' section shows four nodes in a 2x2 grid. Each node entry includes a circular status icon (green for online, red for offline, or grey for connecting), the node's hostname, its IP address, and its current status. The 'Non-Configured Nodes' section shows one node, Stockholm-870, which is online. The interface uses a dark blue background with white text and icons.

Configured Nodes		2 / 4 Nodes Online	
	Beijing-410 10.180.10.24 Online / Asymmetric		Berlin-820 10.180.10.20 Online / Symmetric
	Cincinnati-410 10.180.10.23 Connecting...		London-820 10.180.10.21 Offline

Non-Configured Nodes		1 / 1 Nodes Online
	Stockholm-870 10.180.10.22 Online	

Each Node can be identified by the Node's hostname. The hostname of each Node can be configured on its own Web interface under the *Hostname* field of the *Network Connections* page.

In addition to the hostname, the leading IP address will be displayed. This will usually be the IP address which was used to add the Node on the *Add Remote Node* page.

Finally the current status of the Node is displayed alongside an icon. The connection to the Node can be in one of four states:

Connection Active (Symmetric) Node is active with connected paths. Node also has a fully configured connection back.

Connection Active (Asymmetric) Node is active with connected paths. Node does not have a fully configured connection back. Note that acceleration will still work as normal with a Node in this state.

Connection Inactive Connection can not be made to a previously available Node. You may still remove the remote Node as usual.

Connecting Remote Node is configured with this device and is waiting upon a connection to be made. You may still remove the remote Node configuration as usual.

Clicking on the icon for a remote Node will take you to the management page for the remote Node.

4.1.1.1 Configured Nodes

This list represents Nodes that have been directly added. Nodes in this list have additional configuration options available for them.

4.1.1.2 Non-Configured Nodes

This list represents Nodes that have made an inbound connection, but have not been directly added. *Relationships* and *VPN* tunnels can still be created for Nodes in this state and acceleration can still be performed. A *Non-Configured Node* can become a *Configured Node* by performing the *Add Remote Node* operation on it; doing so will enable additional configuration options.

4.1.2 Add Remote Node

To add a remote Node, click on the *Add Remote Node* icon on the Node Management page.

The following page will allow you to add a remote Node using the *IP Address*.

A screenshot of the "Add Remote Node" web interface. The page has a dark blue header with the title "Add Remote Node" in white. On the left, there is a sidebar with a "Hostname" section containing links: Home (house icon), Nodes (up arrow icon), Reboot (power icon), Logout (logout icon), Support (envelope icon), and Help (question mark icon). The main content area is titled "New Remote Node Details" and contains a warning box with an exclamation mark icon and text: "Ensure that the IP address you are connecting to has been added to the Whitelist to allow it to connect back, otherwise the attempt will time out. This is not required if the remote Node is behind network address translation." Below the warning box, there are two input fields: "IP Address:" with a text input box, and "Network Interface:" with a dropdown menu showing "Port 1 (10.10.64.102)". At the bottom right of the form, there are two buttons: "Cancel" and "Add".

This page allows a remote Node to be added to the list of connected Nodes. The *IP Address* field

takes input of the IPv4 address of the remote Node. The *Network Interface* drop-down menu allows for the selection of the WAN interface on this Node to be used to initiate the connection to the remote Node, if this Node has WAN capabilities mapped to more than one. See Chapter 12: [Port Mappings](#) for information on adding and removing WAN capabilities to network interfaces.

To add a remote Node, enter the IPv4 address of a WAN port on the remote Node which is visible to this Node, and click the *Add* button. If the remote Node is behind a NAT connection, the public IP address for the NAT connection should be used.

A dialog box will appear indicating the connection attempt to the remote Node, and will alert you to the success or failure of the Node connection. Any remote Node connection that has been added to the local Node in this way will be automatically saved, and will restore on reboot until the Node is removed.

4.1.3 Transfer Statistics

This configuration page will allow you to monitor, in real time, the performance of a link over the span of a minute and download the performance data between the local and the remote Node over the last 24 hours.

From the Node Management screen, select the *Transfer Statistics* icon.

The web interface will now display the following window:

Transfer Statistics

Node Menu

 Home

 Nodes

 Reboot

 Logout

 Support

 Help

Licensed To

Bridgeworks Ltd

Remote Nodes

Select a Node from the list below to view transfer information.

Remote Node Name

Berlin-800

Stockholm-200: (Offline)

Data Transfer Rate

[Download 24 Hour CSV File](#)

To view a remote Node's transfer rate, click on the name of the Node from the *Remote Node Name* list, and graphing will start automatically.

A remote Node will be shown as offline if the link to it has not been re-established after a system restart. You cannot start monitoring performance data to a remote Node until the link has been re-established. An offline Node is indicated if the name of the Node has *Offline* next to it, as shown.

Important: If there are no remote Nodes online then you will not be able to see the *Data Transmission Rate* graph or the *24 Hour Transfer History* button.

4.1.3.1 Data Transfer Rate

This section shows both the *transmission* and the *receive* rate for the Node. The transmission rate is in blue and the receive rate is in orange.

Note: Because these parameters are always in a state of continual monitoring by the AI, clicking to view these figures will not affect the performance of the data transfer.

The solid, horizontal, blue and orange lines across the graph show the average *transmission* and *receive* rates respectively over the displayed one minute period.

Hovering the mouse over any of the *transmission* or *receive* data points will display the exact value at that point.

4.1.3.2 Download 24 Hour Transfer History

You are able to download the transfer rate statistics of the previous 24 hours by clicking on the *Download 24 Hour CSV File* button. The downloaded file is in .csv format and can be viewed in a compatible program. See Appendix F: [Transfer Statistics Graphing Instructions for Excel 2010](#) for information on viewing this file.

Note: The 24 hour statistics are cleared on reboot.

4.1.4 Access Control

To configure access control settings, click on the *Access Control* icon on the Node Management page.

The following page will be displayed:

4.1.4.1 Remote Administration

The *Enable Remote Administration* checkbox allows for the disabling or enabling of remote access of this Node. You can start a Remote Access session from the Node Management page of the remote Node, see Section [4.2.7: Remote Control](#).

4.1.4.2 Whitelist

By default, the *Enable Whitelist* checkbox will be selected, which stops incoming WANrockIT connections from IP addresses not explicitly specified. Clearing the checkbox will instead allow all incoming WANrockIT connections.

To allow a new connection from a remote Node, enter the IP address of the remote Node's WAN interface in to the *New IP* field and click *Add*. Multiple addresses can be added for each connected remote Node, and are required for multiple paths.

To delete a listing, select the entry in the *Whitelisted IP Addresses* table and then click *Remove*.

	<p>Important: Adding or removing entries from the whitelist will not take effect until the Save button is clicked.</p>
---	--

4.1.5 IPsec

IPsec can be enabled on all WAN connections, using AES encryption. To configure IPsec, click on the *IPsec Configuration* icon found at the top of the Node Management page.

The web interface will now display the following window:

Important: Additional UDP ports must be open on any firewalls between the Node and the external WAN connection before configuring IPsec. For more information on which ports need to be opened, please see [Appendix A: IP Protocols and Port Numbers](#)

4.1.5.1 Enabling IPsec service

Checking the *Enable IPsec* checkbox will allow the IPsec encryption service to start after clicking the *Save* button. Traffic moving through the Node will not be encrypted at this point. Unchecking this box will stop the IPsec service without removing any of the configurations on this page.

4.1.5.2 Encrypting Accelerated Traffic

Accelerated traffic can be encrypted using the *Encrypt Accelerated Traffic* checkbox as long as the service has been started and a PSK has been set.

Important: A pre-shared key is necessary for both VPN connections, and WAN link encryption.

4.1.5.3 Adding a PSK (Pre-Shared Key)

In the *IPsec Pre-Shared Key* field, enter a value or use the *Generate Key* button to set the PSK. If the *Generate Key* button was used to create the key, copy and paste it to the *IPsec Configuration* page of each connected Node.

Important: A matching pre-shared key must be entered on all connected Nodes.

Important: The PSK must be at least 16 characters and at most 256 characters.

The pre-shared key will not display automatically when returning to this page. If you need to copy it to another Node, click the *Show Key* button.

Important: A warning will appear when configuring IPsec over an unsecured connection (i.e. HTTP rather than HTTPS). To ensure your pre-shared key cannot be intercepted over your network connection, enable HTTPS before configuring IPsec as explained in Section [3.2.3: Secure Connection](#).

The entered pre-shared key is saved in a secure configuration store, and is not removed automatically when IPsec is disabled. To delete your pre-shared key, click *Delete Key*. This will disable any VPN connections, and WAN link encryption, if either is enabled.

4.2 WANrockIT Node Page

The *WANrockIT Node* page has all the configuration settings and applications used to set up a specific remote Node. Clicking on any *Remote Node* icon on the *Node Management* page will take you to the equivalent *WANrockIT Node* page for that remote Node.

Once loaded, the following page should be displayed:

WANrockIT Node - Stockholm-870

Applications & Utilities

Remote Control

Learn

SCSI Devices

Note: Available configuration options and applications shown will vary based on the specific *Product Type* of the remote Node.

Note: Available configuration options and applications are limited if the selected remote Node is considered *Non-Configured*.

4.2.1 Node Status

This section contains information about the remote Node:

State The current connection state for the remote Node. Potential values include: *Online*, *Connecting* or *Offline*.

Active Paths Both the total number of available paths to the remote Node as well as the number that are currently active.

Model Model number of the remote Node.

Negotiated Bandwidth Maximum licensed bandwidth limit between the two Nodes.

TX/RX Current transfer and receive statistics to and from the remote Node respectively.

53

Remote Configuration *Present or Not Present* indicating whether or not the remote Node has a full configuration back to this Node. This value may take a few seconds to update after a configuration change.

Note: Some status elements may appear as *Unknown* if the selected remote Node is considered *Non-Configured*.

4.2.2 Node Configuration

All settings specific to this remote Node are located here. More information for these options can be found in the following sections:

- Section [4.2.4: Path Configuration](#)
- Section [4.2.5: Node Specific Transfer Statistics](#)
- Section [4.2.6: Remove Node](#)

4.2.3 Applications & Utilities

Any available *Applications* or *Utilities* are displayed here. More information for these options can be found in the following sections:

- Section [4.2.7: Remote Control](#)
- Section [4.2.8: Learn](#)
- Section [4.2.9: SCSI Devices](#)

4.2.4 Path Configuration

The WANrockIT Node will always attempt to get the best performance possible for the data it is transferring. Upon establishing a connection between two WANrockIT Nodes, an automatic check for other connections through their WAN ports will occur.

To view and modify link settings between two Nodes, navigate to the *Path Configuration* page from the management page of the remote Node.

A table will be displayed showing all paths between the current Node and the remote Node.

Path Configuration

Filtering options: Hide Unavailable Paths

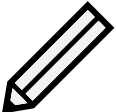

Local Address/ Remote Address	Path State	Bandwidth Limit	Path Type	Failover Target / ID
10.10.64.205/10.10.64.144	✓	<input type="checkbox"/> 0 MB/s	Primary	Any
10.10.64.205/10.10.64.94	✓	<input type="checkbox"/> 0 MB/s	Failover	Path 2
10.10.64.205/10.10.64.142	✓	<input type="checkbox"/> 0 MB/s	Failover	Path 3
10.10.64.205/10.10.64.143	✓	<input type="checkbox"/> 0 MB/s	Failover	Path 4
10.10.64.205/10.10.64.153	✓	<input type="checkbox"/> 0 MB/s	Failover	Path 5

Cancel

Save

4.2.4.1 Setting Primary and Failover Paths

A path is a connection between two IP addresses when you establish a link between two WANrockIT Nodes. Once the “primary” path is established, the Nodes will then automatically check for other available connections to each other through their WAN ports. Any additional connections that are found will automatically be set as ‘failover’ paths. A failover path will not be used unless the primary path fails. You can also select a *Primary Failover* path which will be the first used in the event of a failure with the primary path. To choose a Primary Failover path, select the path that you wish to use from the *Failover Target/ID* drop down box on the far right of the path table.

Note: The order in which failover paths are used, after any initial Primary Failover path, is set automatically and cannot be manually changed.

To change the primary path, click on the *Path Type* drop-down of the primary path and select *Failover* from the drop down list. Click on the *Path Type* drop box of the path that you wish to set as the new primary path and select *Primary* from the drop down list. Click on *Save* to save your changes.

Note: Multiple links can be assigned as “primary paths”; the WANrockIT Node will automatically attempt to use all available primary links simultaneously. There must be at least one primary path designated at any time.

An icon in the *Path State* box will indicate the state of each path:

Link Up Represents a known link that is up.

Known Link Down Represents a known link that is down.

Unavailable Link Represents a possible link that has not been connected to.

4.2.4.2 Filtering options

By default, this page will hide unavailable paths. In order to show unavailable paths, select *None* from the *Filtering options* drop-down.

4.2.4.3 Configuring a Node's Bandwidth

If there is other traffic on your network that needs to access a share of your bandwidth, you can limit the bandwidth between your Nodes. The limit is applied on a per path basis.

To set a limit on a connection, select the *Bandwidth Limit* checkbox next to the connection that you wish to limit. This will enable the bandwidth limit field next to the checkbox. Enter a value in megabytes per second and click the *Save* button.

Note: The minimum bandwidth limit you can set is 1 MB/s.

To remove a *Bandwidth Limit* untick the *Bandwidth Limit* checkbox on the desired connection, and click *Save*. The limit will then be lifted. A bandwidth limit of 0MB/s indicates that no restriction is being applied.

Note: Any changes to the bandwidth limit will become effective immediately on pressing *Save*.

4.2.5 Node Specific Transfer Statistics

This page allows you to monitor, in real time, the performance of the link between your Node and a remote Node.

Navigate to the management page of the remote Node and click the *Transfer Statistics* icon.

The web interface will then display the following window:

4.2.5.1 Data Transfer Rate

This section shows both the *transmission* and the *receive* rate for the Node. The transmission rate is in blue and the receive rate is in orange.

Note: Because these parameters are always in a state of continual monitoring by the AI, clicking to view these figures will not affect the performance of the data transfer.

The solid, horizontal, blue and orange lines across the graph show the average *transmission* and *receive* rates respectively over the displayed one minute period.

Hovering the mouse over any of the *transmission* or *receive* data points will display the exact value at that point.

4.2.5.2 Download 24 Hour Transfer History

You are able to download the transfer rate statistics of the previous 24 hours by clicking on the *Download 24 Hour CSV File* button. The downloaded file is in .csv format and can be viewed in a compatible program. See Appendix F: [Transfer Statistics Graphing Instructions for Excel 2010](#) for information on viewing this file.

Note: The 24 hour statistics are cleared on reboot.

4.2.6 Remove Node

To remove outgoing configurations for a remote Node, navigate to the management page of the remote Node and click the *Remove Node* icon.

The following page will be displayed:

This page allows the administrator to disconnect from a remote Node, removing it from the list of connected Nodes and permanently deleting all outgoing configurations to that Node. To disconnect from a remote Node, click the *Remove* button.

Disconnecting from a Node will immediately terminate traffic between the local and remote subnets, and you will lose any configured Node settings that may have been set.

4.2.7 Remote Control

This page allows remote web interface access to a Node, which is useful when it is not possible to directly access the web interface of a remote Node.

To use remote control functionality, go to the management page of the remote Node and select the *Remote Control* icon.

To enable remote control, click the *Start* button.

The web interface will appear in a new window or tab, displaying the login screen of the remote Node. At the top of the web page will be a yellow bar displaying the name of the remote Node you are connected to. The rest of the page will display the login screen of the remote Node. You can log in with the remote Node's usual credentials.

	<p>Important: Your web browser may prevent the new window from appearing. Consult your web browser's documentation for information on how to allow the new window.</p>
--	--

Remote Control Link - "hostname"

If you close the remote Node window with an HTTP connection, the session will continue to run. You may resume an HTTP remote session at any time by returning to the remote Node page and clicking the *Show Remote GUI* button. An HTTPS remote session to a Node will require reauthorisation if the session is left. To stop a remote Node session, click the *Stop* button.

4.2.8 Learn

The learn procedure will initiate the *Artificial Intelligence* module, analysing the characteristics of the link network. Once it has completed, it will store these values to improve future data transfers.

A learn can be started by navigating to a Node's management page and selecting the *Learn* icon.

Clicking the *Start Learn* button will begin the learn procedure. A graph of the data transferred during the process will be displayed:

The learn process will take approximately five minutes. Navigating away from this page will not terminate the learn. The learn procedure can be run concurrently for multiple Nodes.

Important: Running a Learn operation uses large amounts of data between this Node and the remote Node, and thus may incur data charges.

Once the learn procedure is complete, the status message below the graph will read *Learn Successful*. A learn can be terminated before completion by clicking the *Stop Learn* button.

4.2.8.1 Data Transfer Rate

This section shows both the *transmission* and the *receive* rate for the Node. The transmission rate is in blue and the receive rate is in orange.

Note: Because these parameters are always in a state of continual monitoring by the AI, clicking to view these figures will not affect the performance of the data transfer.

The solid, horizontal, blue and orange lines across the graph show the average *transmission* and *receive* rates respectively over the displayed one minute period.

Hovering the mouse over any of the *transmission* or *receive* data points will display the exact value at that point.

4.2.9 SCSI Devices

This configuration page will allow you to force a refresh of any SCSI devices that may have been added to the remote Node.

From the management page of the remote Node, select the *SCSI Devices* icon under the *Applications & Utilities* section.

The web interface will then display the following:

4.2.9.1 Restoring of Devices

When a Node has been restarted and is in the process of re-establishing its link to another Node, the Node's name, and the name of any connected devices, may have *(Connecting)* after them as shown:

All the functionality that can be used when a Node is active can be used whilst a Node is connecting but the effects will not occur until the link is up.

4.2.9.2 Disabling a Device

To disable a device from the remote Node, uncheck the *Enable* checkbox. All connected devices can be disabled at once using the *Disable all Devices* button.

4.2.9.3 Enabling a Device

To enable a device from the remote Node, check the *Enable* checkbox. All connected devices can be enabled at once using the *Enable all Devices* button.

4.2.9.4 Refreshing SCSI Devices from a Remote Node

To refresh the list of devices, click on the *Refresh Devices* button at the bottom of the screen. A loading dialog box will appear as shown:

Once the refresh process has completed, a dialog box will appear to notify you about the connected Node and attached devices, as shown:

- Help

Display Options

Phy display filter:

Live Update: ☒

Host - Slot 2 4 links active

Slot	Device	Status
A-1	3.0 Gbit Expander	Active
A-2	3.0 Gbit Expander	Active
A-3	3.0 Gbit Expander	Active
A-4	3.0 Gbit Expander	Active
B-1	Unknown No Device	Inactive
B-2	Unknown No Device	Inactive
B-3	Unknown No Device	Inactive
B-4	Unknown No Device	Inactive

Note: The *SAS Initiator* page may look different than pictured depending on your configuration.

5.1 SAS Initiator Page

This page displays physical SAS cards (or “hosts”) contained within your unit, and any devices to which they are connected (such as disk drives or expanders). A host will contain four phys for every physical port on the card.

5.1.1 Hosts

The heading of a host section shows the following information:

Chevron An arrow for expanding or collapsing the section.

Name (e.g. Host 1).

Active Connections A display of the number of connections available (e.g. 4 links active).

Under the host heading, a number of phys will be displayed. The icon represents their state.

End Device A device is connected

No Device No device is connected

Expander Device An expander is connected

The text to the right of each icon displays information relating to the phy:

Device identifier The identifier of the device, shown with a letter and a number (e.g. “B-3”). The letter pertains to the physical port, as displayed on your port mapping page.

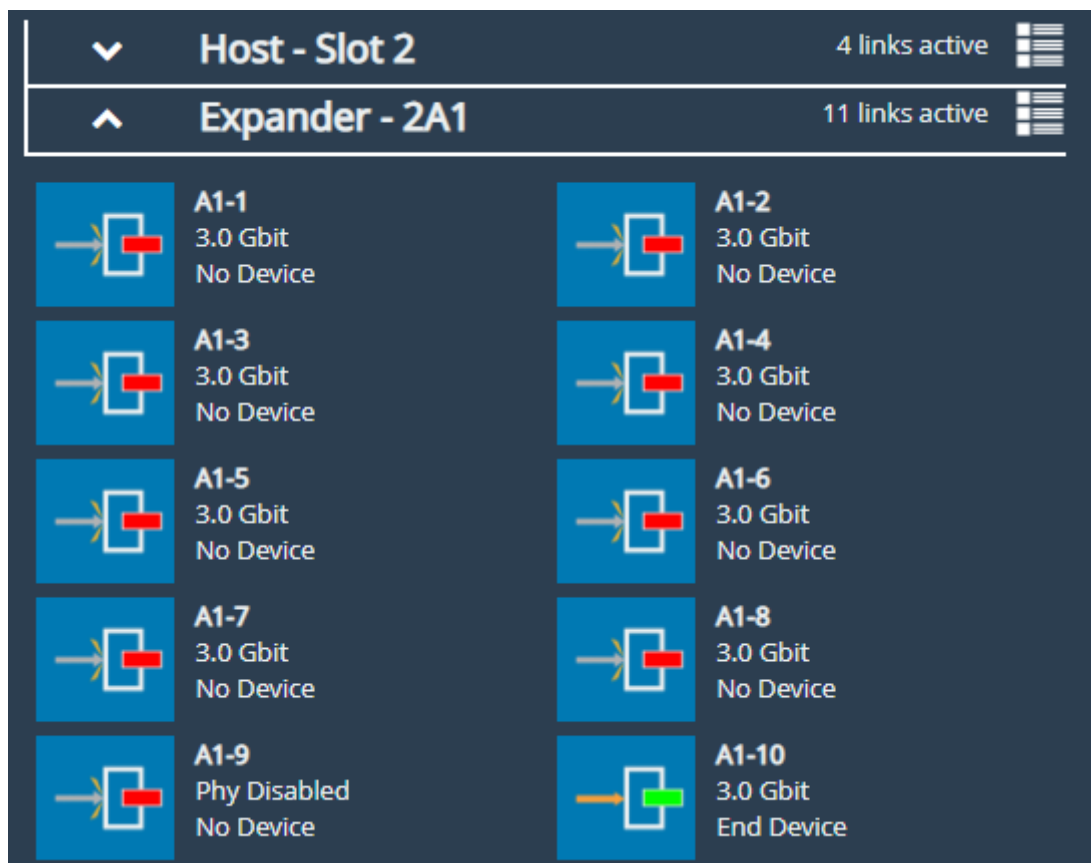

Link speed The negotiated link speed of the device. This will show a speed if a physical connection is made (e.g. “6.0 Gbit”), or otherwise displays “Unknown”.

Device type Whether there is an end device, no device, or expander (as represented by the icon).

If expanders are connected to a host, they will appear in their own sections starting underneath all listed hosts. The header contains number and letter designations pertaining to host it is connected to. For example, the 1st expander connected to port **A** of Host **2** will be labelled “SAS Expander - 2A1”. The display of the heading and the phys of an expander mirrors the host phys exactly.

5.1.2 Expanders

Expanders are displayed in a similar manner to hosts. The title bar continues to show a chevron, the name of the expander, and the links active. All the phys of expander are shown underneath this heading, using the same icons as hosts.

The name of an expander signifies its origin, and its level. For example, an expander named **2A1** originates from the 2nd host, from physical port **A**, and is the 1st level of expander from that port.

Phys from an expander are similarly named. A phy from expander **2A1** may be labelled **A1-12**, where **A** represents the physical origin port, **1** represents the level of expander from that port, and **12** represents the number of the phy.

5.1.3 Display Options

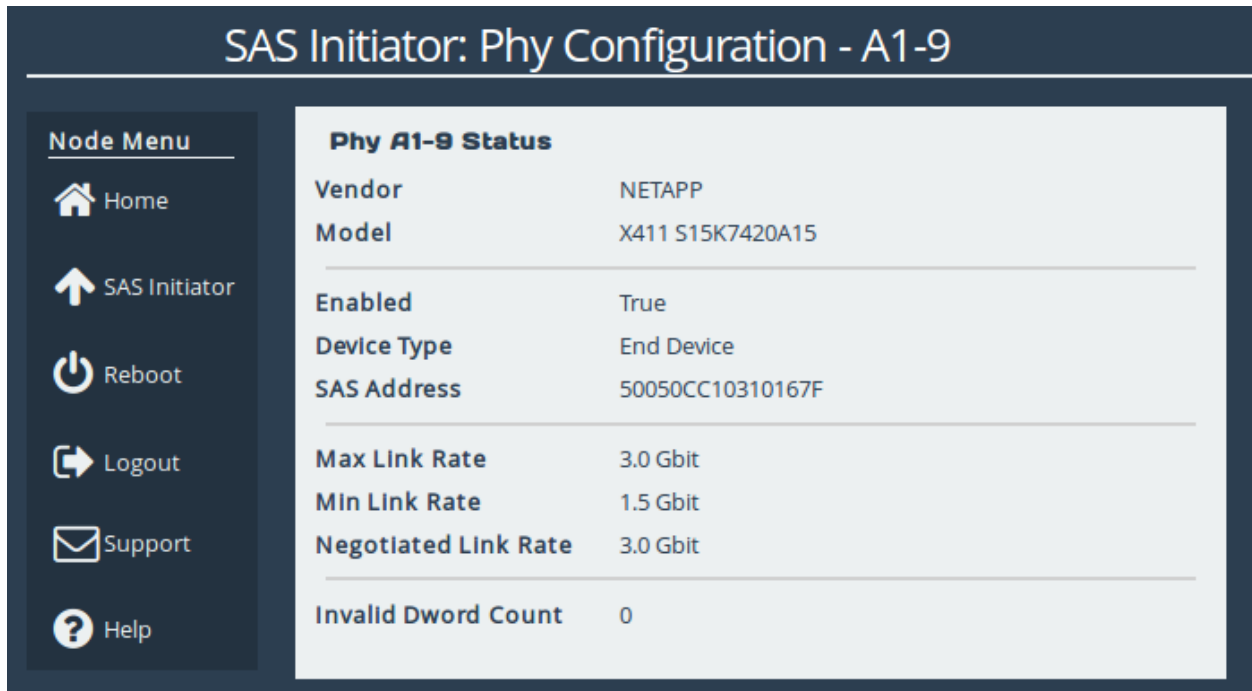

Options are available for configuring how devices are viewed. These are:

Phy display filter Show all phys, or choose to display phys based on whether they are connected.

Live update Ticked will update all phy information on the page every two seconds. Unticked will leave device information as it is at the time of unticking.

5.2 Phy Status Page

Clicking on a phy, either under a host or an expander, will lead to a status page showing information about that phy, as shown below. This shows information about the device as it was at the time of page load.

SAS Initiator: Phy Configuration - A1-9

Phy A1-9 Status

Vendor	NETAPP
Model	X411 S15K7420A15
Enabled	True
Device Type	End Device
SAS Address	50050CC10310167F
Max Link Rate	3.0 Gbit
Min Link Rate	1.5 Gbit
Negotiated Link Rate	3.0 Gbit
Invalid Dword Count	0

Information differs per connected device and not all fields will show on the page. Possible data includes:

Vendor Manufacturer of the device.

Product Product name of the attached expander.

Model Model name of the attached end device.

Enabled True or false.

Device Type No device, end device, or expander.

SAS Address Unique address of the SAS host the phy is from.

Max Link Rate Maximum link speed allowed by the hardware.

Min Link Rate Minimum link speed allowed by the hardware.

Negotiated Link Rate Link speed currently used for transfers. Unknown if no link rate has been decided.

Invalid Dword Count Number of malformed Dwords received.

6 Fibre Channel Initiator Connections

Note: You may skip reading this section if your WANrockIT Node does not have a Fibre Channel feature card installed.

This configuration page allows the administrator to configure ports designated as Fibre Channel Initiator interfaces. To designate a Fibre Channel port as an initiator, see Chapter 8: [Fibre Channel Port Configuration](#).

From the Home screen of the web interface, select the *FC Initiator* icon from the *Devices and Protocols* section.

You will see the following page:

This page lists each Fibre Channel port which has been designated as an initiator. Three pieces of information are displayed about each port next to an icon. In order they are:

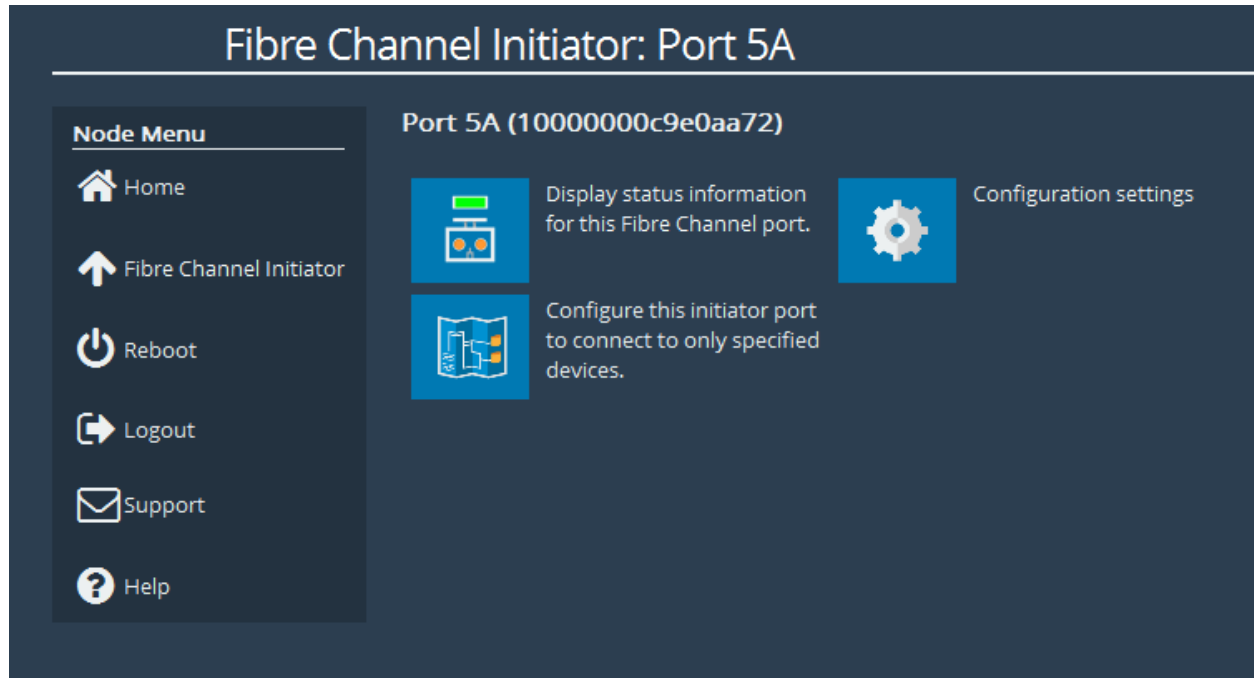

Port designation the number is the designation of the PCI slot, and the letter 'A' or 'B' denotes that this is the left, or right-hand port of that slot, respectively.

Current state This shows whether the Fibre Channel link for this port is up or down, and the speed

of the link if it is currently up.

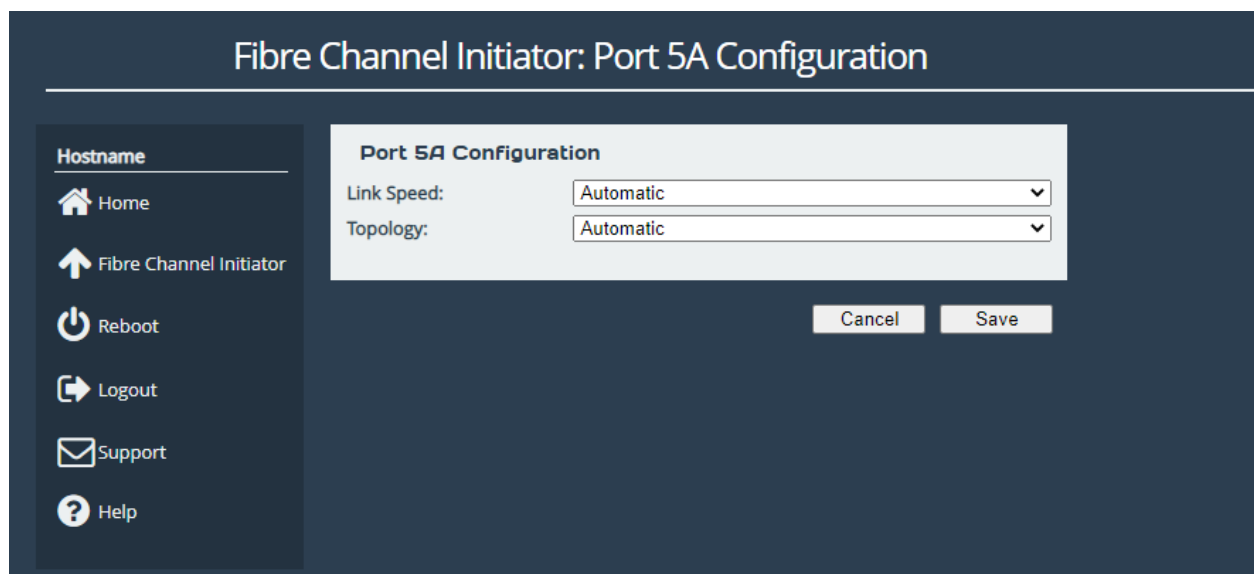

WWPN The unique World Wide Name identifier for this port.

Selecting one of the icons will navigate to the page for that initiator port, with 3 options:

Display status information for this Fibre Channel port allows you to see verbose information about the Fibre Channel port.

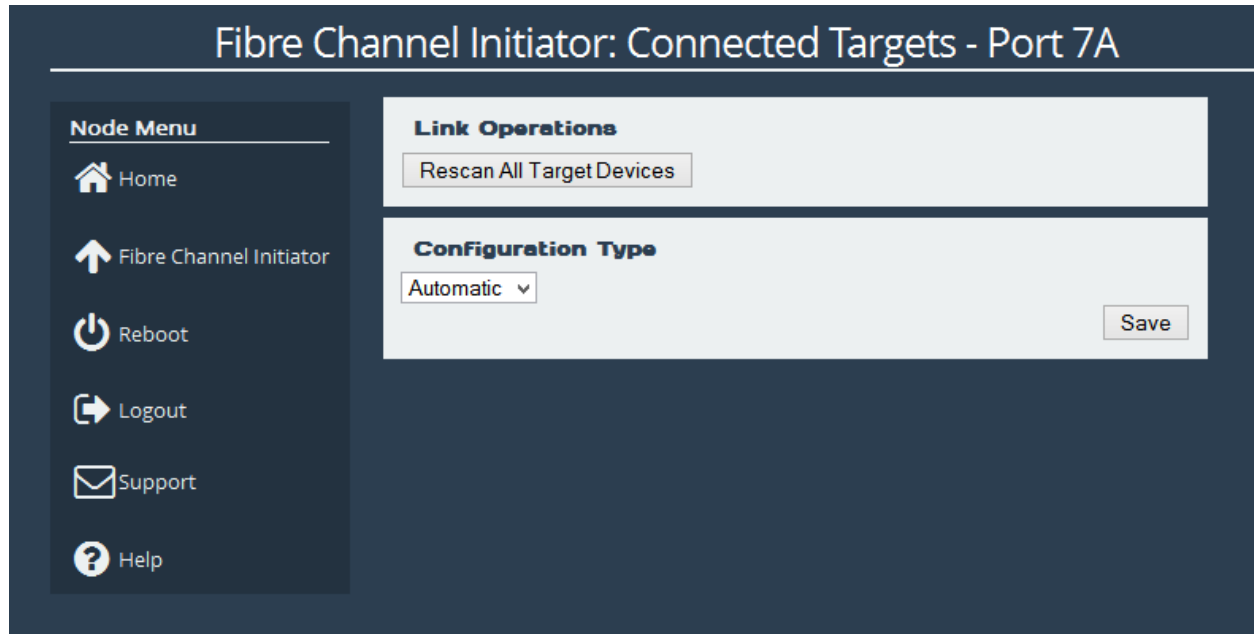

Configuration settings allows you to manually configure the *Link Speed* and *Port Topology*:

1. The *Link Speed* can be set to *Automatic* or one of the speeds supported by the Fibre Channel port. In most cases this option may be left set to *Automatic*. If you are unsure, set the link speed to the SFP speed. This option is not available on some products.

2. The *Topology* pull down menu has 3 options: *Automatic*, *Loop (arbitrated Loop, FC-AL)*, and *Point-to-Point (FC-P2P)*. It is recommended that you leave this option at *Automatic* unless you wish to force the link into a known topology.

Configure this initiator port to connect to only specified devices allows you to disable certain connected Fibre Channel targets.

The default configuration type is set to *Automatic*. Using the *Configuration Type* drop down, you can change this to manual. This allows you to enable or disable each individual target on the Fibre Channel link.

Select the FC target by clicking on its World Wide Port name, and then click *Enable* or *Disable*.

7 Fibre Channel Target Connections

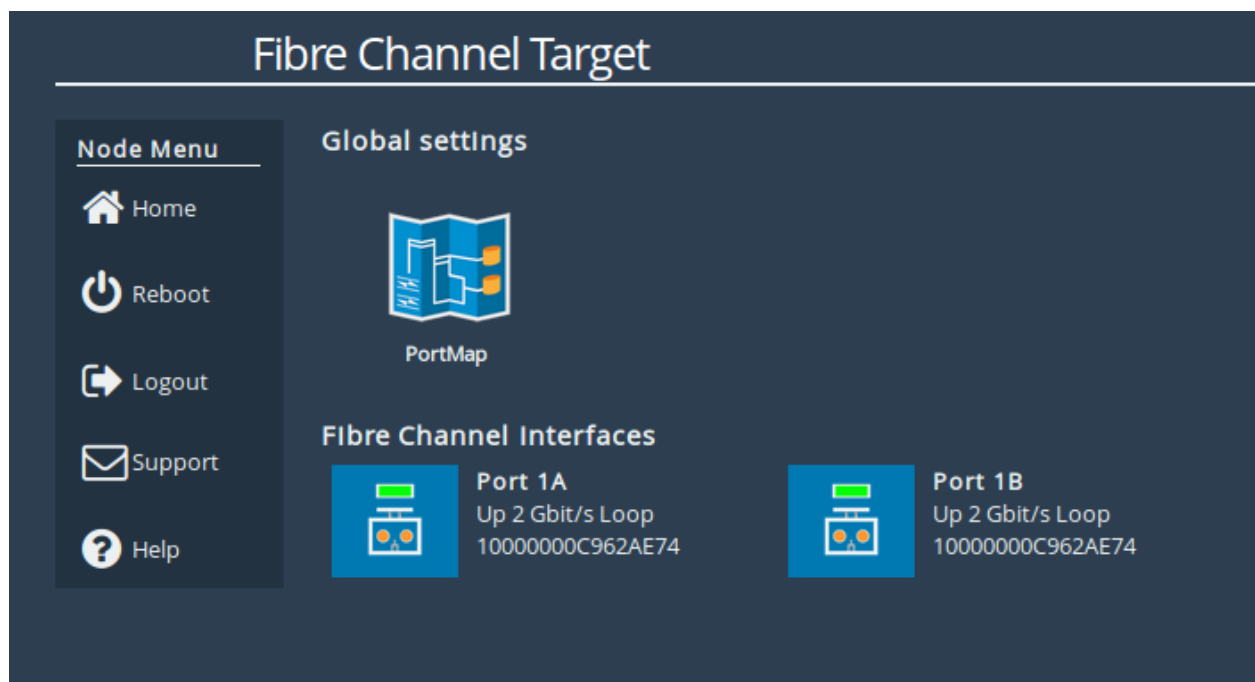

Note: You may skip reading this section if your WANrockIT Node does not have a Fibre Channel feature card installed.

This configuration page allows the user to configure ports designated as Fibre Channel Target interfaces. To designate a Fibre Channel port as a target, see Chapter 8: [Fibre Channel Port Configuration](#).

From the Home screen of the web interface, select the *FC Target* icon from the *Devices and Protocols* section.

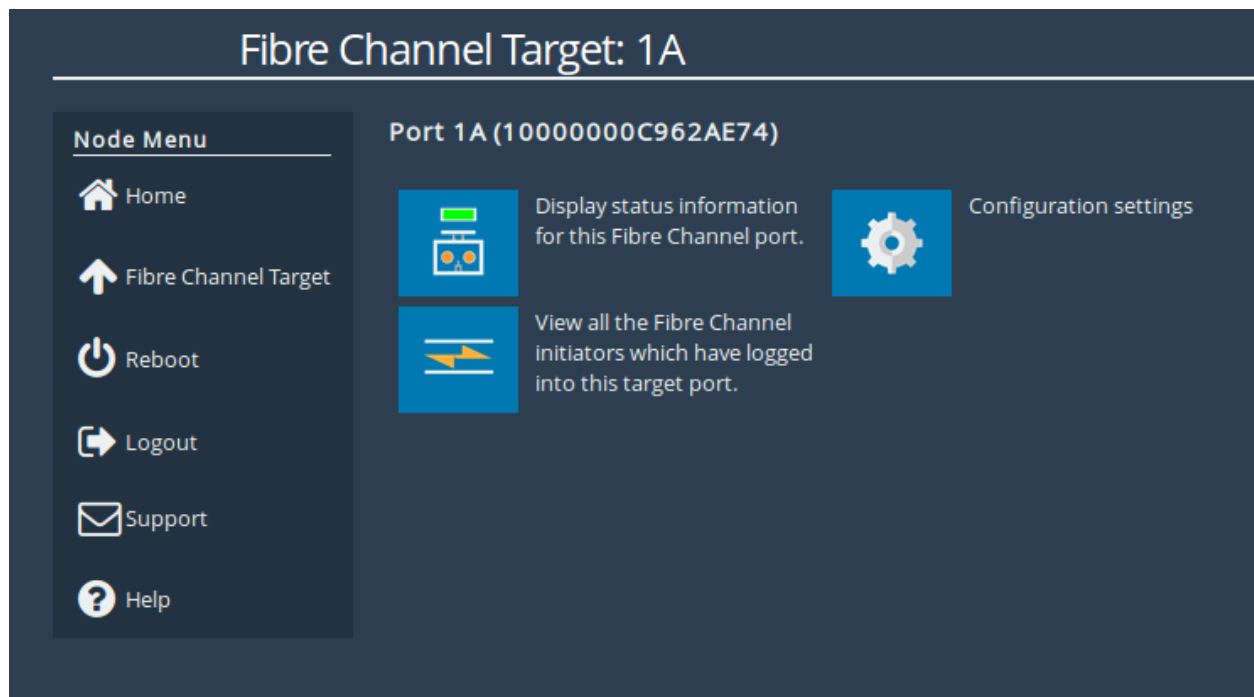

The web interface will then display the following:

The icons displayed in the *Fibre Channel Interfaces* section show the current state of each Fibre Channel Port.

The green or red light in the icon display whether the port is up or down. This is also shown in text next to each icon with the negotiated Fibre Channel speed and the selected topology. The port WWN is also shown next to each icon.

Clicking on an icon will display different options related to the specific port as shown:

7.1 Port Configuration

Selecting the *Configuration settings* icon will display the following:

The first parameter is the *Port Enable* check box. Check this to enable the link onto the Fibre Channel Storage Area Network (SAN).

The *Link Speed* drop down menu allows you to select the Fibre Channel network speed. In most cases this can be kept as *Automatic*.

The *Topology* drop down menu allows you to force the Fibre Channel topology when the Node logs on to the Fibre Channel SAN.

Note: It is recommended to leave *Hard AL_PA* unchecked unless you are conversant with the lower levels of the Fibre Channel protocol, as certain AL_PA addresses are reserved.

The *Enable tERP* check box, which is only present for 8Gb/s cards, will enable or disable the Target Error Recovery Protocol for the port. tERP will attempt to recover frames that are missed or time out during transfer. For tERP to correctly function, the connected initiator must also support tERP.

Clicking *Save* will save the configuration to memory for use at the next reboot.

7.2 Connected Hosts

To list which hosts are connected to the Node, select a port under *Fibre Channel Interfaces*, then select the icon labelled *View all the Fibre Channel initiators which have logged into this target port*. The following will then be displayed:

Fibre Channel Target: Connected Hosts - Port 1

Hostname

- Home
- Fibre Channel Target

Cancel Remove All Remove

New Device Assignment

Device & Logical Unit: --- Select a Target --- ▾
Port: --- Select a Port --- ▾
LUN: Input LUN Number

Add Assignment

Save

There are two modes of operation:

Automatic will assign all devices to all Fibre Channel target ports, so that any connected host will see all devices.

Manual will allow the user to manually assign which target devices appear on which Fibre Channel port.

When switching between modes all changes are held pending until the user selects *Save*.

7.3.1 Automatic

In this mode the *Port Assignments* table shows the active mappings. When switching from manual to automatic mode the display will show the manual mappings greyed out until user selects *Save* at which point they will be updated with the active automatic mappings.

Important: When *Automatic* port mapping is selected, LUN order is not guaranteed to be the same between reboots.

7.3.2 Manual

Selecting *Manual* will show something similar to the following:

The screenshot displays a configuration window with the following sections:

- Configuration Type:** A dropdown menu set to "Manual".
- Port Assignment:** A table with columns for Target Port, LUN, and Devices (WWN and LUN). It contains five entries, all with a green background indicating pending changes.
- Buttons:** "Cancel", "Remove All", and "Remove" are located below the Port Assignment table.
- New Device Assignment:** A section with three input fields: "Device & Logical Unit:" (dropdown), "Port:" (dropdown), and "LUN:" (text input). An "Add Assignment" button is at the bottom right of this section.
- Save Button:** A "Save" button is located at the bottom right of the entire window.

Target Port	LUN	Devices	
Port	LUN	WWN	LUN
FCTPORT1	13	iqn.1991-05.com.microsoft:win-rdp25uho s8m-ramdisk-target,t,0x000001	7
FCTPORT1	2	iqn.1991-05.com.microsoft:win-rdp25uho s8m-ramdisk-target,t,0x000001	18
FCTPORT1	5	iqn.1991-05.com.microsoft:win-rdp25uho s8m-ramdisk-target,t,0x000001	15
FCTPORT1	0	iqn.1991-05.com.microsoft:win-rdp25uho s8m-ramdisk-target,t,0x000001	20
FCTPORT1	7	iqn.1991-05.com.microsoft:win-rdp25uho	13

When switching from *Automatic* to *Manual* the mapping is prepopulated with the same settings as those currently active. Initially all entries are shown in green to indicate these are pending changes which will be added upon save. Similarly if the user deletes an active mapping it will be shown in red as a pending removal as shown in the following example:

Port Assignment

Target Port	Devices		
Port	LUN	WWN	LUN
FCTPORT1	0	iqn.1991-05.com.microsoft:win-rdp25uhos 8m-ramdisk-target,t,0x000001	0

Remove

To assign a target device to a Fibre Channel Port:

1. Select a target device from the list in the *Device & Logical Unit* drop down menu. Note that devices that are already mapped are greyed out.
2. Select which Fibre Channel Port you wish the device to appear on.
3. Select the LUN you wish the device to have on the selected Fibre Channel Port.
4. Click the *Add Assignment* button at the bottom of the panel.

To remove a mapped device, select the device from the table and click the *Remove* button below the table. To remove all mapped devices, click the *Remove All* button.

Selecting *Cancel* allows the user to abandon any pending changes.

Important: Manually assigned LUN mappings should be sequential and include a LUN 0 to ensure correct operation.

8 Fibre Channel Port Configuration

This page allows the administrator to designate whether a port is a target or an initiator.

From the Home screen of the web interface, select the *FC Port Configuration* icon from the *Devices and Protocols* section.

You will see the following page:

A screenshot of the "Fibre Channel Port Configuration" web interface. The page has a dark blue header with the title "Fibre Channel Port Configuration". On the left is a "Node Menu" sidebar with icons and links for Home, Reboot, Logout, Support, and Help. The main content area is titled "Port Configuration" and contains a table with six rows, each representing a Fibre Channel port (5A, 5B, 6A, 6B, 7A, 7B). Each row has a dropdown menu to its right, currently showing "Target" or "Initiator". At the bottom right of the table are "Cancel" and "Save" buttons.

Port Configuration	
Fibre Channel Port 5A:	Target ▼
Fibre Channel Port 5B:	Initiator ▼
Fibre Channel Port 6A:	Target ▼
Fibre Channel Port 6B:	Initiator ▼
Fibre Channel Port 7A:	Target ▼
Fibre Channel Port 7B:	Initiator ▼

Cancel Save

To change a port between a target or initiator use the drop down box next to the desired port and click on the *Save* button. Clicking *Cancel* will ignore any changes made on the page.

Important: Changes to Fibre Channel Port designation will require a reboot to take effect.

9 iSCSI Initiator Configuration

Note: You may skip reading this section if your WANrockIT Node does not have an iSCSI feature card installed.

This section details configurations for the iSCSI initiator. To help your understanding of iSCSI terms, please see Section [1.3: Definitions](#).

Adding a device to the iSCSI Node requires two basic steps:

- Discover iSCSI target(s) on the target portal
- Log on to the iSCSI target(s)

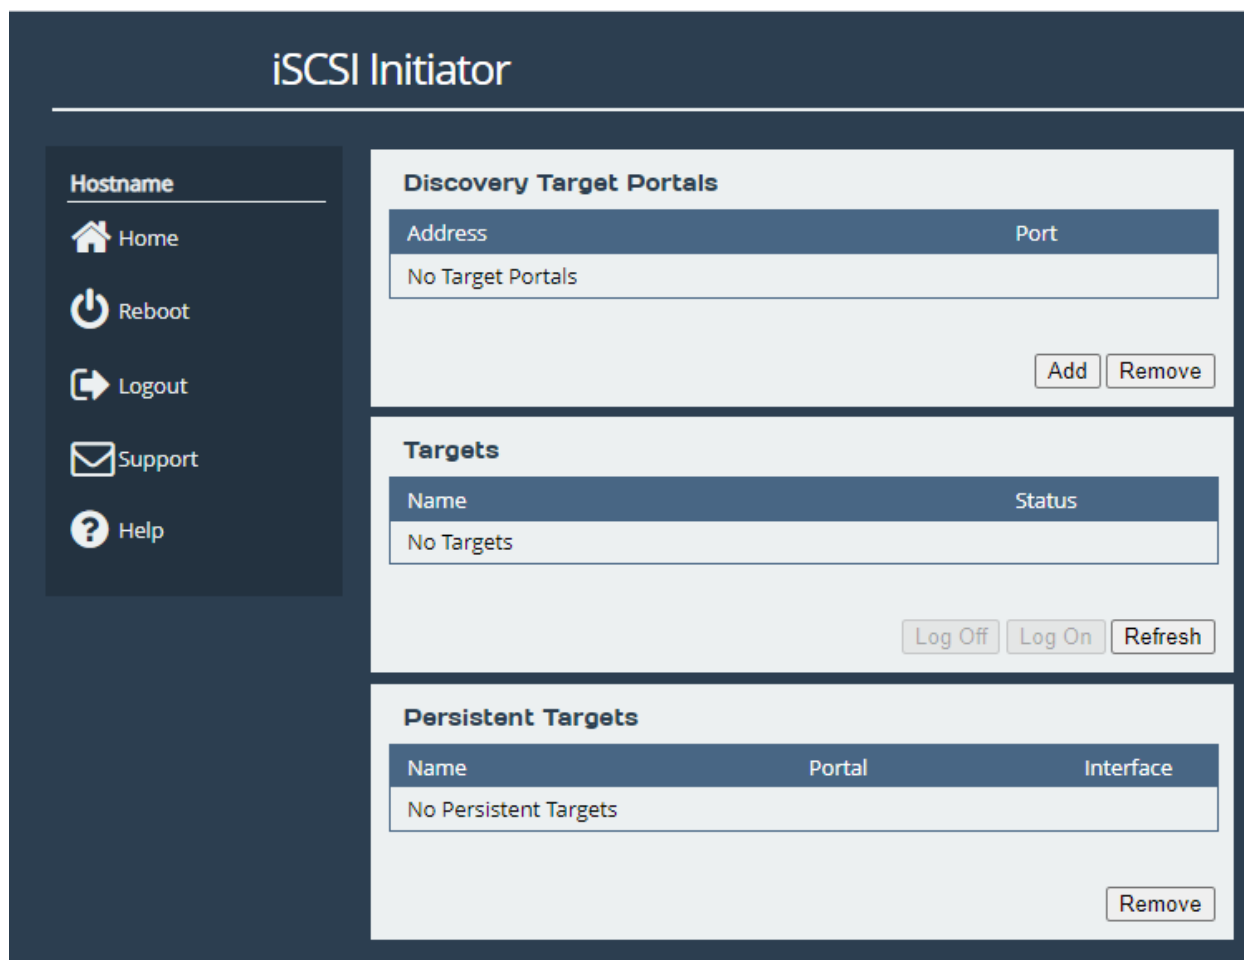

The following sequence is repeated for each device you wish to connect to the iSCSI Node.

9.1 Discovering an iSCSI Target

From the Home screen, click on the *iSCSI Initiator* icon under the *Devices and Protocols* section.

The web interface will then display the following:

Click on the *Add* button in the *Discovery Target Portals* box. An *Add Discovery Portal* dialog box will then appear:

Add Discovery Portal

Discovery Portal

IP Address:

Port:

3260

Source Interface:

Port 2 (192.168.2.8) ▼

☐ CHAP Login

Name:

iqn.2002-12.com.4bridgeworks.

Target Secret:

OK

Cancel

Insert the *IP Address* of the iSCSI target portal you wish to connect to and select the *Source Interface* from the drop down list.

If the iSCSI device has CHAP enabled for discoveries then you will need to check the *CHAP Login* box and fill in the name and target secret. When complete, click the *OK* button.

The Node will now perform an iSCSI Discovery. This will request the target portal to list the target devices connected to it. Any devices found will appear in the *Targets* list. If the iSCSI target has more than one device attached, then all of these devices will be shown.

Hostname

Home

Reboot

Logout

Support

Help

Discovery Target Portals

Address	Port
192.168.2.4	3260

AddRemove

Targets

Name	Status
iqn.1991-05.com.microsoft:win-rdp25uhos8m-ramdisk-target	inactive

Log OffLog OnRefresh

Persistent Targets

Name	Portal	Interface
No Persistent Targets		

Remove

In the example above we can see that the target portal with IP Address 192.168.2.4 has one device attached to it. The device's status is *inactive*, because the Node has not yet connected to it. To connect to the device, an iSCSI logon must be performed.

9.2 Removing an iSCSI Discovery Portal

From the *Discovery Target Portals* list select the IP address of the target portal you wish to remove. The background colour of the IP address will change to yellow. Click the *Remove* button, and the following message will appear:

"Are you sure you want remove the selected discovery portal?"

Click the *OK* button to confirm.

9.3 Log On to an iSCSI Target

To log on to an IQN, highlight the IQN by clicking on its entry in the *Targets* list and then click the *Log On* button. At this point a new window will appear, as shown:

Login to iSCSI Target

iqn.1991-05.com.microsoft:win-rdp25uhos8m-ramdisk-target

Persistent Connection

☒ Automatically restore this connection on boot.

Connect by using

Source Interface:
Port 2 (192.168.2.8)

Target Portal:
192.168.2.4:3260,1

CRC / Checksum

☐ Data Digest
☐ Header Digest

☐ CHAP Login

Name:
iqn.2002-12.com.4bridgeworks.

Target Secret:

OK

Cancel

9.3.1 Persistent Connection

If you wish for the Node to connect to this IQN after a reboot, select the *Automatically restore this connection on boot* checkbox. It is recommended that this feature is enabled.

Note: Devices with *Persistent Connection* enabled will also be displayed in the *Persistent Targets* list below the *Targets* list.

9.3.2 CRC/Checksum

On the login page there are options in the CRC/Checksum section to enable *Data Digest* and *Header Digest*.

When Data Digest is enabled, the system performs a checksum over each Protocol Data Unit's (PDU's) data part and verifies using the CRC32C algorithm. This increases data integrity, but will impact performance.

When Header Digest is enabled, the system performs a checksum over each iSCSI PDU's header

part and verifies using the CRC32C algorithm. This increases data integrity.

9.3.3 CHAP Login

If the iSCSI target device has CHAP enabled, select the *CHAP Login* checkbox, enter the name and target secret to communicate with this device.

Once you have completed this window, click the *OK* button.

The Node should now display the IQN with the word *Connected* next to it. Repeat this process for all the required iSCSI target devices.

9.4 Log Off an iSCSI Session

From the *Targets* list, select the target you wish to remove. The background colour of the selected target will change to yellow. Click the *Log Off* button below, and the following message will appear:

“Are you sure you want to Log Off?”

Click the *OK* button if you wish for the target to become inactive.

9.5 Refresh Targets

If at a point after the initial discovery, a target portal has had additional targets added to it, the *Refresh* button will update the targets list to present those devices.

9.6 Remove Persistent Target

If a target has been made to be persistent, it will appear in the *Persistent Targets* list. To stop the iSCSI session from restoring on reboot, select the target from the *Persistent Targets* list. The background colour of the selected target will change to yellow. Click on the *Remove* button, and the following message will appear:

“Are you sure you want to remove the selected persistent target?”

Click the *OK* button if you wish to stop the iSCSI session from restoring on reboot.

10 iSCSI Target Configuration

Note: You may skip reading this section if your WANrockIT Node does not have an iSCSI feature card installed.

This page allows you to configure mutual CHAP authorisation, and TCP ports of each iSCSI target interface.

From the Home screen of the web interface, select the *iSCSI Target* icon under the *Devices and Protocols* section.

The web interface will then display the following:

iSCSI Target

Hostname

- Home
- Reboot
- Logout
- Support
- Help

Authorisation

 While secrets longer than 16 characters are allowed, they may be unsupported by some hosts.

Enable CHAP:

☐

Username:

Initiator Secret:

Target Secret:

Network Interfaces

Interface	Configured TCP Port(s)
Port 2 (10.10.10.87):	3260 ▼

Cancel

Save

88

10.1 Authorisation (CHAP)

CHAP is an authentication scheme used by servers to validate the identity of clients, and vice versa. When CHAP is enabled, the initiator must send the correct username and target password to gain access to the iSCSI target of the Node.

The initiator secret is provided to allow iSCSI mutual CHAP. If mutual CHAP is selected on the initiator, the iSCSI Bridge will authenticate itself with the initiator using the initiator secret.

To enable CHAP, select the *Enable CHAP* checkbox and enter the following details:

Username This is the same name as specified on the initiating host.

Initiator Secret This is the password defined on the initiating host. This must be 12 to 256 characters long. This should only be entered if mutual CHAP is enabled on the initiating host.

Target Secret This is the password that must be entered on the initiating host. This must be 12 to 256 characters long.

Note: While secrets longer than 16 characters are allowed, they may be unsupported by some hosts.

10.2 Network Interfaces

The table under the Network Interfaces section displays the interfaces and IP addresses the iSCSI target is presenting devices on.

The iSCSI protocol officially uses two main TCP ports: 3260 and 860. For each iSCSI target interface, you can choose to enable either one these TCP ports, or both, or disable iSCSI on the interface completely, from the *Configured TCP Port(s)* dropdown.

10.3 iSCSI Sessions

Each initiator will open at least one session with each target device it is logged on to. The iSCSI Sessions page in the web interface of the WANrockIT Node can be used to review these connections.

From the Home screen, select the *iSCSI Sessions* icon under the *Devices and Protocols* section.

The web interface will then display the following:

Hostname

Home

Reboot

Logout

Support

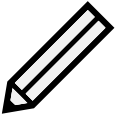

Help

iSCSI Sessions

Initiator	Target
iqn.1991-05.com.microsoft:kevin.test.d omain	iqn.2002-12.com.4bridgeworks.001bd 1:eui.00041B0002001BD1.0,t,0x00000

Refresh

This page lists current connections to iSCSI initiators. The IQN of the initiator is shown in the *Initiator* column, and the IQN of the device it is logged on to is shown in the *Target* column. See [Section 1.3.2: iSCSI Qualified Name \(IQN\)](#) for more information.

Note: It is possible that more than one initiating host may be connected to any target device, one host to multiple target devices, or one host has multiple connections to a single device.

11 SCSI Device Management

This page allows you to view details of devices connected to the WANrockIT Node, and devices attached to a connected remote Node.

11.1 Viewing Attached Devices

From within the Home screen of the web interface, select the *SCSI Device Management* icon under the *Devices and Protocols* section.

The web interface will then display the following:

You will be presented with a list of all the devices connected to the WANrockIT Node.

If your WANrockIT Node is connected to a remote Node, devices connected to the remote Node will also be displayed on this page under the *Devices registered from other WANrockIT Nodes* section.

Clicking on a device will open a page displaying more information about the device, as shown below.

Ok

12 Port Mappings

Port Mappings allow you to configure which network ports will have support for which protocols. Navigate to the *Port Mappings* page from the main page of the web interface.

The web interface will display the following:

Port Mappings

Node Menu

- Home
- Reboot
- Logout
- Support
- Help

Licensed To

Bridgeworks Ltd

Instructions

Select which protocols should be active on each network interface. After saving changes, reboot the product for the new configuration to take effect.

Protocols for Port 1:

Management x

Add a protocol...

Protocols for Port 2:

Management xWAN x

Add a protocol...

Protocols for Port 3:

Management x

Add a protocol...

Cancel

Save

Hardware appliances have dedicated management ports, but can have the Management protocol assigned to additional ports.

93

12.1 Setting Port Mappings

To set up protocols on a network port, select an option from the corresponding *Add a protocol...* drop down box.

When a protocol has been applied to a port, a blue box corresponding to the protocol will appear under the port, as shown below.

Port Mappings

Hostname

- Home
- Reboot
- Logout
- Support
- Help

Instructions

Select which protocols should be active on each network interface. After saving changes, reboot the product for the new configuration to take effect.

Protocols for Port 1:

Management X

Add a protocol... ▼

Protocols for Port 2:

Management X WAN X

Add a protocol... ▼

Protocols for Port 3:

Management X

Add a protocol... ▼

Cancel Save

Note: Hardware appliances will apply some mappings to the PCI slot instead of individual ports, enabling the protocol for all ports on the card in that slot.

12.2 Removing a Port Mapping

To remove a mapping, click on the “X” next to the protocol as shown below.

12.3 Saving Port Mappings

To save the Port Mapping configuration, press the **Save** button at the bottom of the page. This will return you to the Home screen.

Important: Saving the Port Mappings configuration will require a reboot to take effect.

12.4 Available Port Mappings

Licences are required before mappings can be applied. Licences may have speed restrictions, limiting which ports the licence can be mapped to; these licences have an additional suffix after the protocol name. An example licence is *WAN 10 Gb* which can only be applied to ports capable of 10Gb speeds. See [Section 13.5: Licence Key Management](#) for help managing and uploading new licence keys.

Hardware appliances will display a summary of licences in the *Licensed Adapters* table, as shown below.

Licensed Adapters		
Feature Type	Limit	Assigned
Management	Unlimited	0
WAN 1 Gb	2	2

Provided the matching licences have been purchased and the product has the appropriate cards for the mapping, the following protocols can be added to an available port:

Fibre Channel

Assign a port to be a Fibre Channel Initiator or Target.

iSCSI

Assign a port to be an iSCSI Initiator or Target.

Management

The Management mapping is required to access the Web interface of the Node, and also allows SSH and SNMP connections.

SAS

Assign a port to be a SAS Initiator.

WAN

The WAN port mapping allows this WANrockIT node to connect to another node.

13 Node Maintenance

The following section describes the various pages that are available to the administrator to monitor performance and maintain the Node.

13.1 System Information

This page allows the administrator to view the performance of the Node. From the Home screen, select the *System Information* icon from the *Node Maintenance* section.

The following page will be displayed:

In the *Node & Firmware Details* section, the following information is displayed:

Firmware Revision is the installed firmware revision level.

Serial Number/UUID is the unique identifier of that specific WANrockIT Node.

iSCSI IQN is the iSCSI Qualified Name of that specific WANrockIT Node.

Uptime is the amount of time the WANrockIT Node has been powered on for.

The *System Performance* section contains three meters which provide an approximation of the following performance parameters:

Data Throughput This indicates the current performance in MB/s.

CPU Utilisation This indicates the percentage of the time the CPU is occupied undertaking the management and scheduling the transfer of data between the two interfaces.

Memory Usage This indicates the percentage of memory used by all processes.

The following section will also appear on this page:

Inventory	
Component	Description
Chassis	Model a004
PCI Slot 1	Intel X540 T2 10 Gigabit Network Connection
PCI Slot 2	Emulex Lancer-G6 LPe31002-M6-D Fibre Channel Host Adapter

The *Inventory* section shows the hardware your Node is running on, including the board and any cards installed in it.

13.2 System Log

This page displays the system log, useful for diagnosing problems with the Node, attached devices and connections.

From the Home screen, select the *System Log* icon from the *Node Maintenance* section.

The web interface will now display the following:

System Log

Node Menu

Home

Event Log

Reboot

Logout

Click Here to Download

Clear System Log

© 2017 Bridgeworks Ltd

Below the log display pane are two options:

Click Here to Download This will download the log file to your local machine.

Clear System Log This will clear all logs within the Node.

For information on troubleshooting your Node, see Chapter 14: [Troubleshooting](#).

13.3 Load/Save Configuration

Important: Loading/Saving configuration is unavailable on certain platforms.

The configuration Load/Save feature allows you to save a copy of the Node's configuration to a file and optionally restore back to that configuration at a later time.

Once you have finished configuring your Node we recommend that you save your configuration data to a local disk. By doing so you could save valuable time if the Node requires replacement or if configuration is lost during upgrades.

99

From the Home screen, select the *Load/Save Configuration* icon from the *Node Maintenance* section.

The following page will be displayed:

A screenshot of the "Load/Save Configuration" web interface. The page has a dark blue header with the title "Load/Save Configuration". On the left is a sidebar with a "Hostname" section and links for Home, Reboot, Logout, Support, and Help. The main content area is divided into three sections: "Import Configuration" with a warning message about certificates and buttons for "Choose File" and "Upload"; "Export Configuration" with a "Click Here to Download" button; and "Restore Defaults" with a "Restore Factory Defaults" button.

13.3.1 Loading a Saved Configuration

To reload a configuration, click the *Choose file* button and locate the configuration file to upload to the Node. Once located, click the *Upload* button and the new configuration data will be uploaded.

	Important: Once a valid configuration file is uploaded, a reboot will automatically occur.
---	--

13.3.2 Saving the Configuration to Disk

To save the configuration data, click the *Click Here to Download* button. Then choose to save the file.

The Node will now download an encoded file that contains all of its configuration settings.

13.3.3 Restoring to Factory Defaults

To restore the Node to factory defaults, click the *Restore Factory Defaults* button. This resets all configuration parameters including the hostname, IP addresses and passwords. This option is useful to protect sensitive information if a Node appliance is ever returned for maintenance.

Important: After clicking the *Restore Factory Defaults* button, a reboot will automatically occur.

13.4 Firmware Updates

From time to time it may be necessary to upgrade the firmware within the Node. New versions contain resolutions to known issues as well as new features and improvements to the functionality of the Node.

The *Firmware Updates* page allows the administrator to load new firmware onto the Node. From the Home screen, select the *Firmware Updates* icon from the *Node Maintenance* section.

The following page will be displayed:

Update

After clicking update please wait for this page to change before proceeding.

You can now instruct the Node to check for new firmware versions, alerting you when a new version is available and providing a button to perform the update. Alternatively, you can manually upload and update to a firmware version of your choosing.

13.4.1 Automatic Firmware Update Checking

This section allows your Node to automatically check for new firmware versions, notifying you when a new version is available. This check occurs once per day.

To enable automatic firmware update checking, select the *Check For Updates Automatically* checkbox, then click the *Save* button. The check can be performed immediately by clicking the *Check Now* button.

Note: No information regarding your Node is sent during the check for firmware updates.

When a new firmware version is available, a notification will appear under the *Node Menu*.

To start the firmware update process:

1. Click on the *Install Firmware* button. A progress bar labelled *Downloading* will appear showing the progress in downloading the new firmware on to the WANrockIT Node.
2. When the label above the progress bar changes to *Progress*, you can navigate away from this page and the installation will continue.

Updating the firmware will take a few minutes. After the update is complete, a notification will appear under the *Node Menu*, indicating that a system reboot is necessary. To reboot the Node, click on the *Reboot* button located in the *Node Menu* at the left side of the web interface.

13.4.2 Updating Firmware Manually

It is also possible to download new firmware versions and update manually.

Contact Bridgeworks support at support@4bridgeworks.com providing the serial number of your product to receive the latest version of the firmware.

	<p>Warning: Do not load on a firmware which has an earlier release revision unless you have been instructed to by the Bridgeworks support team. Always ensure that you have the correct firmware for your product.</p> <p>If in any doubt, please contact Bridgeworks support. See Appendix G: Useful Links for contact information.</p>
---	---

Once you have downloaded the new firmware to your local machine:

1. Click on the *Choose file* button to locate the file you have downloaded from the Bridgeworks website.

-
2. Click on the *Update* button to start. A progress bar labelled *Uploading* will appear showing the progress in uploading the new firmware on to the WANrockIT Node.
 3. When the label above the progress bar changes to *Progress*, you can navigate away from this page and the installation will continue.

Updating the firmware will take a few minutes. After the update is complete, a notification will appear under the *Node Menu*, indicating that a system reboot is necessary. To reboot the Node, click on the *Reboot* button located in the *Node Menu* at the left side of the web interface.

13.5 Licence Key Management

This page allows you to view, upload, download or remove licence keys installed on the Node. Licence keys are required to enable features on installed feature cards. See [Chapter 12: Port Mappings](#) for information on assigning licence keys to interfaces.

From the Home screen, select the *Licence Key Management* icon from the *Node Maintenance* section.

The following page will be displayed:

Licence Keys

Node Menu

Licence Key Upload

Licence Key File:

Choose file
No file chosen

Upload

The *Installed Licence Keys* table displays the installed licence keys with the following information:

Feature Type The feature that the licence key enables.

Limit The number of interfaces that the feature may be mapped to.

Expires The amount of time left until a temporary licence key expires. If *N/A* is in this column, it indicates the licence key is not temporary.

When a temporary licence key has expired, there will be a warning on the page and the *Expires* field will say *Expired* as shown in the image above. At the point of expiration, an event will be displayed below the *Node Menu* similar to the one shown below.

Events

4 May 13:42
Licence key with
feature Fibre
Channel has
expired

13.5.1 Uploading a Licence Key

To upload a licence key:

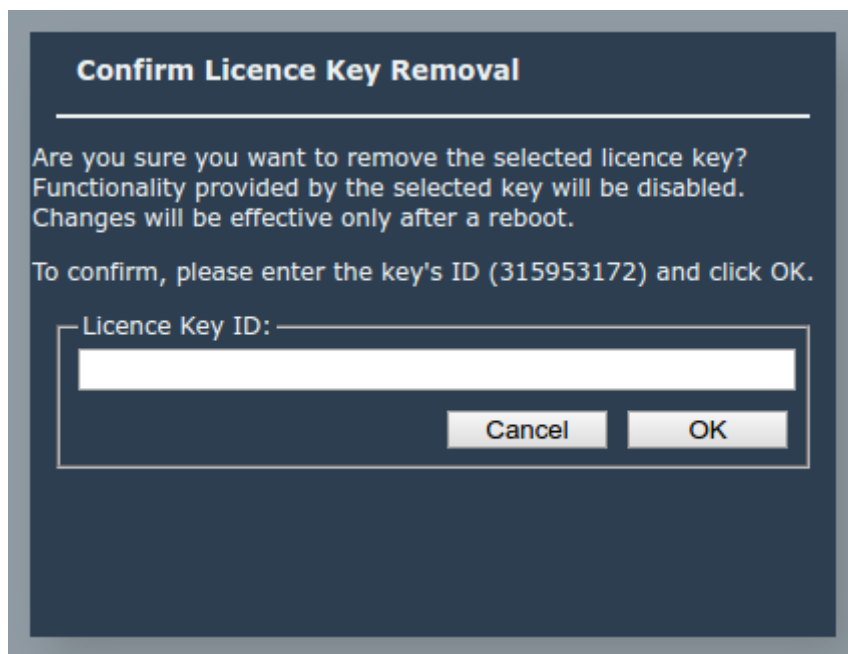

1. Click the *Choose file* button in the *Licence Key Upload* section.
2. Locate and select the licence key to upload.
3. Click the *Upload* button.

After the upload completes, a valid licence key will appear in the *Installed Licence Keys* table.

	Important: The Node will require a reboot for the licence key to be activated.
---	--

13.5.2 Removing a Licence Key

To remove a licence key, select the licence key from the *Installed Licence Keys* table, then click the *Remove* button. This will open a dialog box, as shown below.

Copy the licence key ID into the *Licence Key ID* field and click *OK*. The licence key will be removed from the Node and will no longer be displayed in the *Installed Licence Keys* table.

13.5.3 Downloading a Licence Key

To download a licence key, select the licence key from the *Installed Licence Keys* table, and click *Download*.

13.6 Diagnostics

In the unlikely event that a problem arises with your WANrockIT Node, you may be requested by Bridgeworks Support to provide a diagnostic file.

Important: If an issue arises with your WANrockIT Node, check Chapter [14: Troubleshooting](#) for information on how the issue may be resolved.

Note: The following instructions are demonstrated in the Bridgeworks Support Video “WANrockIT: Downloading Diagnostic Information” found at <https://www.youtube.com/watch?v=8RZXFGCy3ZU>.

To download the diagnostic file, click on the *Diagnostics* icon on the Home screen:

Then click on the *Click Here to Download* button.

Diagnostic Download

[Click Here to Download](#)

This will cause the WANrockIT Node to collect data regarding various modules and store them in a single file. Once this process is complete, a download for “diagnostics.bin” will begin.

13.7 Task Scheduler

This page allows the administrator to schedule tasks with the following actions:

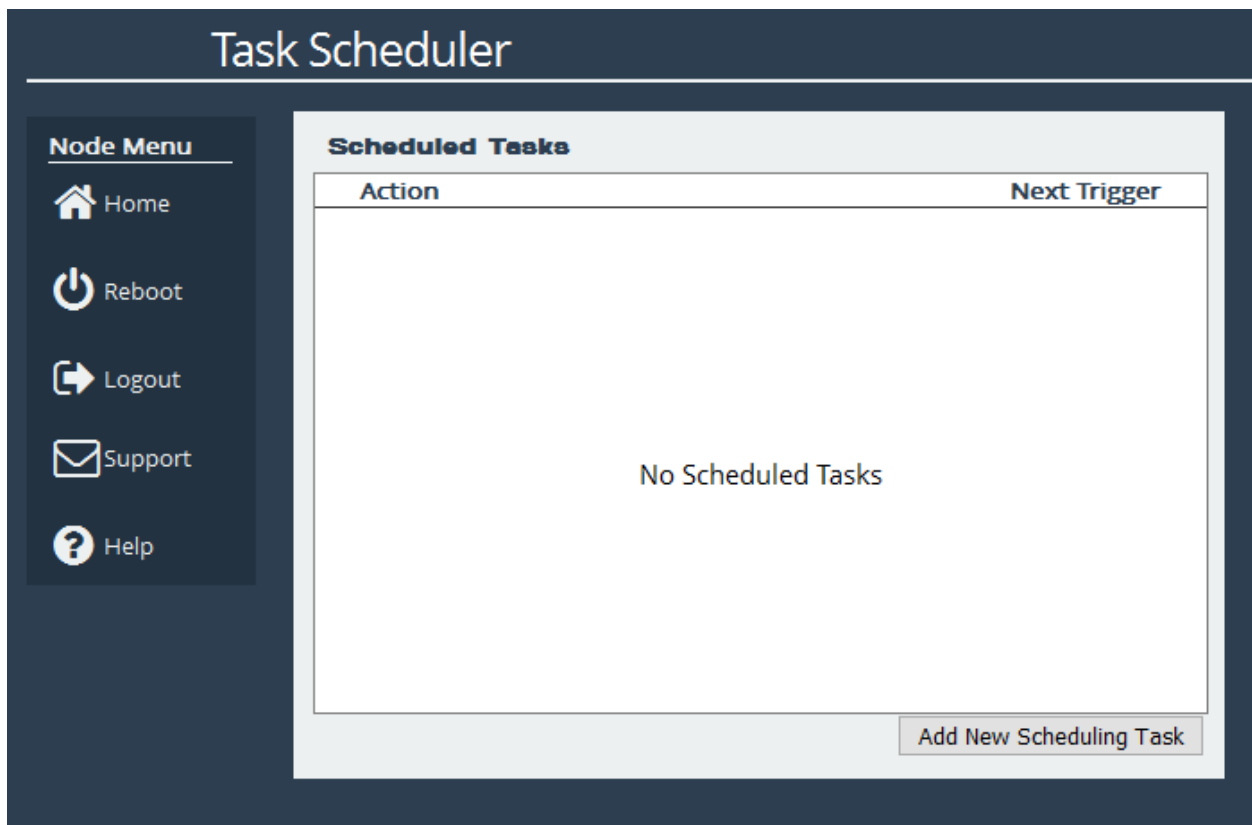

Email Performance Statistics This will email the log of the throughput rate to a given email address(es).

WANrockIT Bandwidth Limit This will restrict the WANrockIT transmission rate to a given number of Megabytes per second.

From the Home screen, select the *Task Scheduler* icon from the *Node Maintenance* section.

The web interface will now display the following:

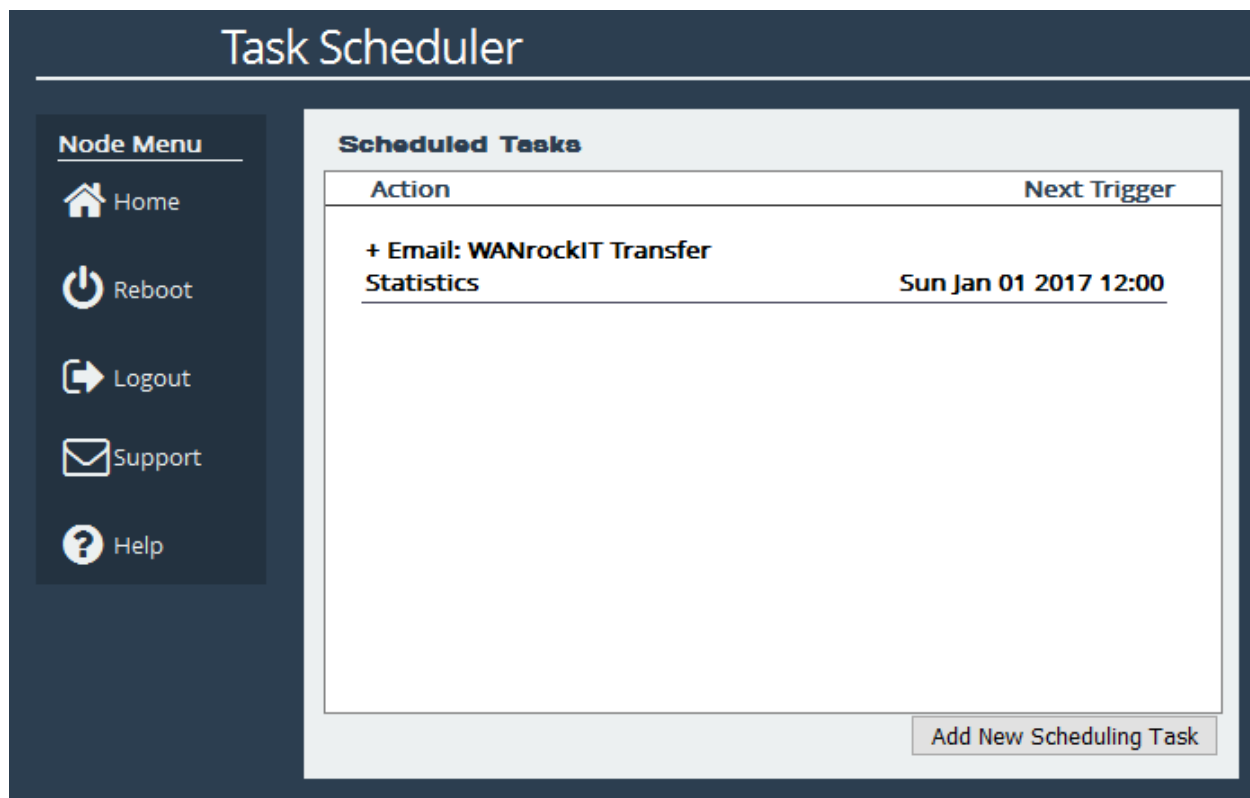

13.7.1 Adding Tasks

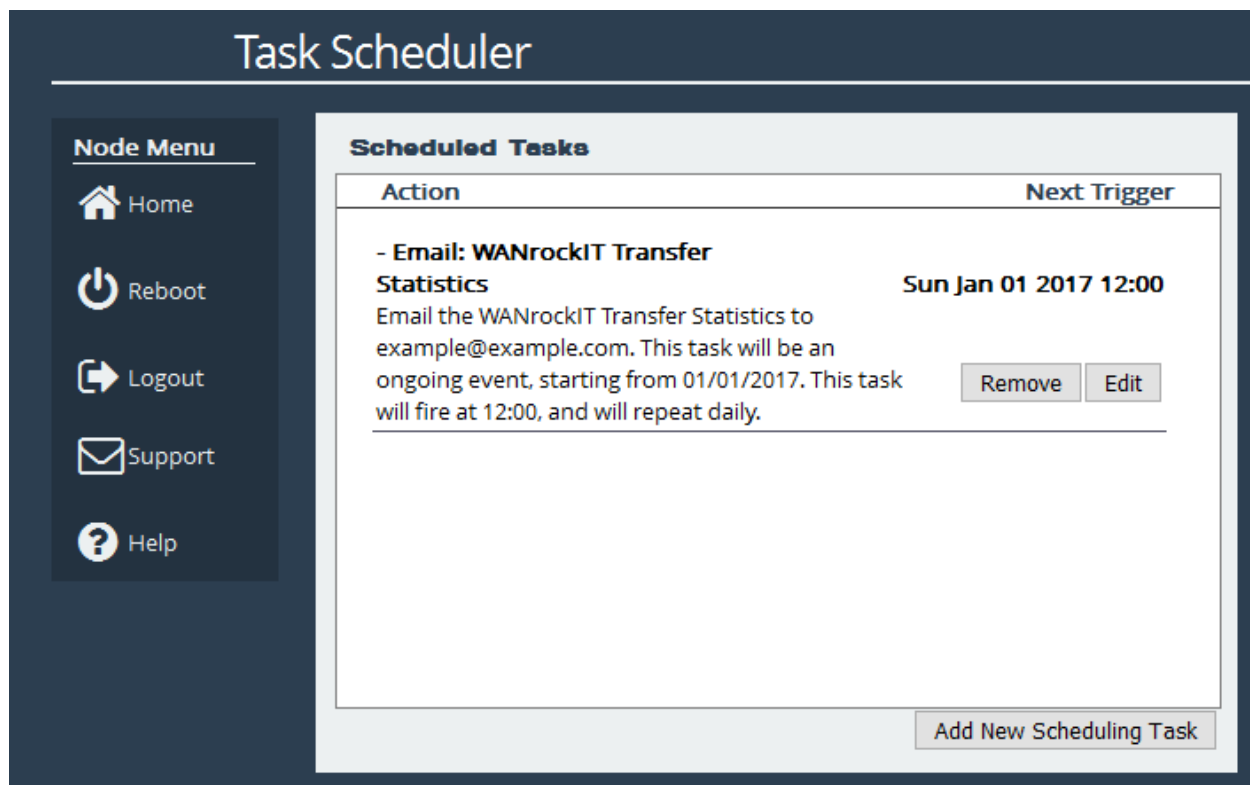

Tasks can be added by clicking on the *Add New Scheduling Task* button, which will start the task wizard.

13.7.2 Removing/Editing Tasks

If you already have some tasks added, they will be listed in the Scheduled Tasks window as shown:

Clicking on a task will expand it as shown:

Clicking the *Remove* button will remove the task from the task scheduler. Clicking the *Edit* button will start the task wizard for the task, allowing it to be edited.

13.7.3 Task Wizard

The task wizard will guide you through the adding or editing of scheduled tasks. There are a few common buttons across the individual sections of the wizard:

Help Clicking this button will display the Online Help page for the Task Scheduler.

Cancel Clicking this button will discard the changes being made to the task and close the wizard.

Next If present, this button will navigate you to the next section of the wizard.

Previous If present, this button will navigate you to the previous section of the wizard.

Note: The currently active section of the wizard will be highlighted in orange on the left-hand side.

13.7.3.1 Action - Email Performance Statistics

On the Action section of the wizard, enter the recipient email(s), separating multiple emails with semi-colons.

Important: If you see the following image, click on the yellow box to be taken to the Service Control page where SMTP can be set up. See Section [3.3.3: Email](#).

Adding New Scheduler Task		Help
1 - Action	Function: Email Performance Statistics ▼	
2 - Trigger	<div>Please setup SMTP Settings before scheduling this function. Click here to take you straight to the setup page.</div>	
3 - Start Date		
4 - End Date		
5 - Summary		
		Next Cancel

13.7.3.2 Action - WANrockIT Bandwidth Limit

Adding New Scheduler Task		Help
1 - Action	Function: WANrockIT Bandwidth Limit ▼	
2 - Trigger	PORTrockIT Bandwidth Limit (MB/s): 0 Unlimited Bandwidth: <input type="checkbox"/> Node: All ▼	
3 - Start Date		
4 - End Date		
5 - Summary		
		Next Cancel

On the Action section of the wizard, enter a bandwidth limit in Megabytes per second or select the *Unlimited Bandwidth* checkbox. Then select which Node and Path should be affected by the bandwidth limit.

13.7.3.3 Trigger

Adding New Scheduler Task Help

1 - Action

How often would you like it to trigger? Daily

2 - Trigger

3 - Start Date

4 - End Date

5 - Summary

Previous Next Cancel

On the Trigger section of the wizard, you can pick the frequency of the event. The options are:

Once This means the action will be performed at the specified time and not repeat.

Daily This means the action will be performed every day at the specified time.

Weekly This means the action will be performed on specified days every week at the specified time. When selecting this option, you will be able to pick which days to trigger the action by selecting checkboxes. Each day will have its own checkbox, as shown:

Adding New Scheduler Task Help

1 - Action

How often would you like it to trigger? Weekly

Select days to trigger on:

Sun	Mon	Tue	Wed	Thu	Fri	Sat

Previous Next Cancel

On the End Date section of the wizard, you can pick the end date for the new task. You can either select the *Ongoing Event* checkbox for a task that should run until cancelled, or select a date using the calendar. The selected date will be marked with a red cross.

13.7.3.6 Summary

The screenshot shows a wizard window titled "Adding New Scheduler Task". On the left is a vertical sidebar with five steps: "1 - Action", "2 - Trigger", "3 - Start Date", "4 - End Date", and "5 - Summary". The "5 - Summary" step is highlighted in orange. The main area of the wizard displays the title "Summary" followed by a description: "Email the WANrockIT Transfer Statistics to example@example.com. This task will be an ongoing event, starting from 01/10/2019. This task will fire at 12:00, and will repeat daily." At the bottom of the wizard, there are three buttons: "Previous" on the left, "Save" in the center, and "Cancel" on the right. A "Help" button is located in the top right corner of the window.

On the Summary section of the wizard, a brief description of the task will be displayed. If you are happy with this task, click the Save button to add the task to the task scheduler. Saving will automatically close the wizard.

14 Troubleshooting

14.1 Network Connectivity Problems

Under normal operation, you should be able to “ping” the network address of the Node and receive a response. If this fails, run through the following list to identify and solve the problem.

- Ensure the Node is powered on. This can be verified on hardware appliances by checking that the power LED is illuminated.
- Ensure that the Ethernet cable is plugged in at both ends.
- For hardware appliances, ensure the *Link indicator* LED of the Ethernet connector is illuminated. If it is not, check with your Network Administrator. Refer to the *Visual Indicators* appendix within the relevant hardware manual for help identifying the LED.
- If you are using a Node with two Management ports and only one network cable, try using the other network address and/or the other Management port.
- If the Node is transferring large amounts of data, then the response from the web interface may seem slower than usual as the process that controls the web interface has the lowest priority for Network and CPU resources.
- If you can “ping” the Node but the web interface fails to appear, check the settings within the web browser you are using. If you are directly connected to the Node then any proxy settings will require adjustment and may require you to contact your Network Administrator.
- Ensure you are using the correct network address and netmask. See Appendix B: [Accessing the Node from Windows using a static IP Address](#).

If none of the above resolves your problem, then after consulting with your Network Administrator, please contact support. See Appendix G: [Useful Links](#) for information on how to contact Bridgeworks Support.

14.2 SCSI Device Related Problems

Once the Node has finished booting up, and the target devices have finished initialising, these devices should be available on the host machine. After checking that you have correctly configured the initiator, run through the following list to identify and solve the problem.

- Ensure that the devices are powered on and are ready - some libraries can take 5 minutes or more before they are ready and appear on the Node. The power up status of libraries are usually displayed on the front panel.
- Ensure that the cables between the Node and the devices are connected.
- Ensure that the CHAP settings for the initiator and the Node are the same.
- Force a rediscovery from the initiating iSCSI host.

- A common mistake is when enabling CHAP only for a device after the initial discovery by the initiator. It will be necessary to remove the address from the discoveries tab and recreate it with the appropriate CHAP settings, otherwise any rediscovers will be attempted without CHAP and no devices will be returned.
- Reboot the devices and the Node.

If none of the above resolves your problem, please contact support. See Appendix [G: Useful Links](#) for information on how to contact Bridgeworks Support.

14.3 Network Performance Problems

Poor network performance can be caused by many differing reasons. The following list is provided as a guide to where you may find ways to improve performance.

- Ensure that the entire network cabling between the network and the Node is of the correct standard.
- Ensure your network and Node are communicating at the fastest possible network speed. Current link speeds can be found next to each interface on the *Network Connections* page. The link speed should be *1000Mb/s* on a 1 Gigabit network link. If it is 10 or 100Mb/s, this will limit the performance dramatically. See Section [3.1: Network Connections](#) for help finding the *Network Connections* page.
- Packet loss can be a cause of poor performance. Within the *Link Status Box* check the number of TX and RX errors for relevant network interfaces that are displayed on each *Network Port* page. This should be zero or a very small number. If these are showing large numbers of errors, check the connections between the Node and the network. See Section [3.1.6: Port Settings](#) for help finding the *Network Port* page.

Link Status

Link State:	Up	Link Speed:	10Gb/s
RX Bytes:	240833	TX Bytes:	859081
RX Errors:	0	TX Errors:	0

Settings

IPv4 Address:	10.10.64.186 /255.255.0.0
IPv6 Address:	2a00:2381:1a72:b:20c:29ff:fe9b:6a9d /64
IPv6 Link Address:	fe80::20c:29ff:fe9b:6a9d%port1 /64
MTU:	1500
Gateway:	Global default via 10.10.10.1 & fe80::222:19ff:fe66:c08b

Mapped Protocols

Management

If none of the above resolves your problem, then after consulting with your Network Administrator, please contact support. See Appendix [G: Useful Links](#) for information on how to contact Bridgeworks Support.

14.4 iSCSI Performance Problems

Poor iSCSI performance can be caused by many differing reasons. The following list is provided as a guide to where you may find ways to improve performance in addition to those found in Section [14.3: Network Performance Problems](#).

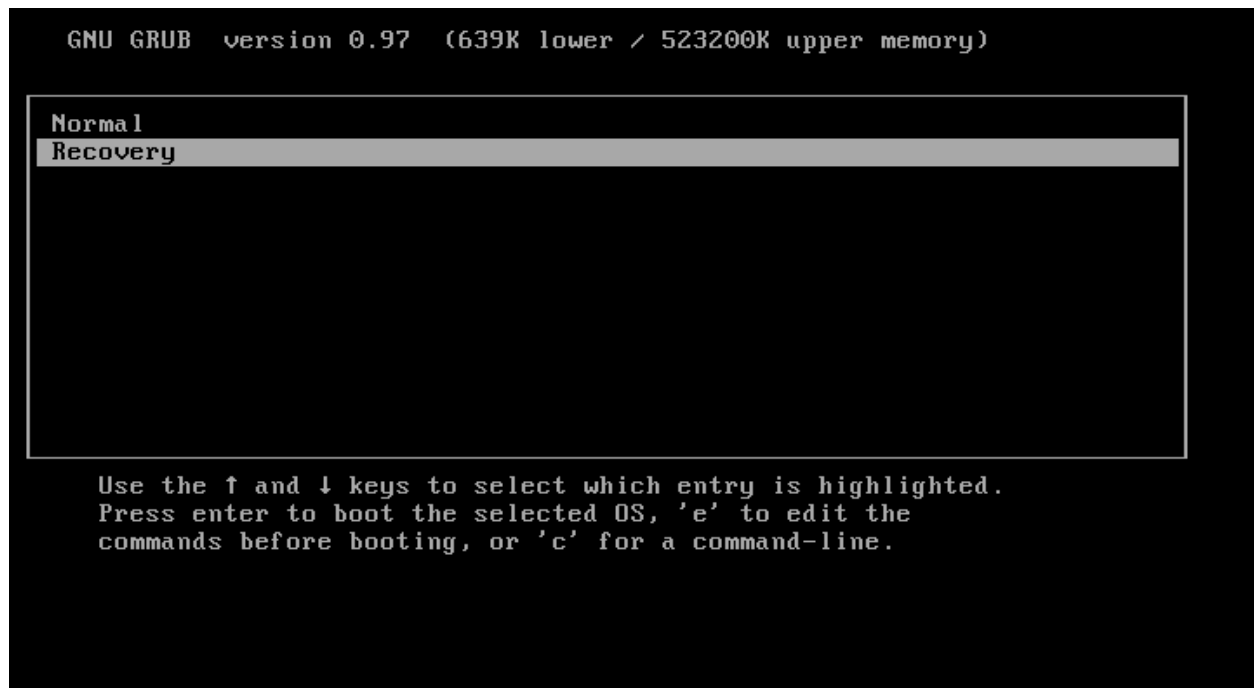

- *Data Digests* are an extra level of error checking on top of the standard TCP/IP checksum error checking (configured on the initiator). However, the calculation of these extra checksums can greatly affect overall performance. Therefore, *Header and Data Digests* should only be enabled where the integrity of the network connection is in doubt. Refer to Appendix [C: Connecting to an iSCSI Device using the Microsoft iSCSI Initiator](#) for more information.
- By enabling *Jumbo Frames* as explained in Section [3.1.6.2: Setting the MTU](#) you can improve the throughput performance of the Node. This will only work if *all* of the components in the infrastructure between the initiator/target and the Node are enabled for jumbo frames. That includes the Host Bus Adapter (HBA), all switches and routers, and the Node itself. If any of the components are not enabled or not capable of handling jumbo frames, then unexplained packet loss or corruption may occur.

If none of the above resolves your problem, please contact support. See Appendix [G: Useful Links](#) for information on how to contact Bridgeworks Support.

14.5 Recovery Wizard

If access to the system is being disrupted because of problems with the configuration file then, in consultation with Bridgeworks support, the following procedures can be used to recover your system.

To access the Recovery Wizard press the *Esc* key during the unit's boot sequence as soon as you see the message "GRUB loading, please wait..." Select the *Recovery* option on the menu that follows.

The Recovery Wizard provides two options for system recovery: restoring your unit to factory defaults, and deleting your configuration file.

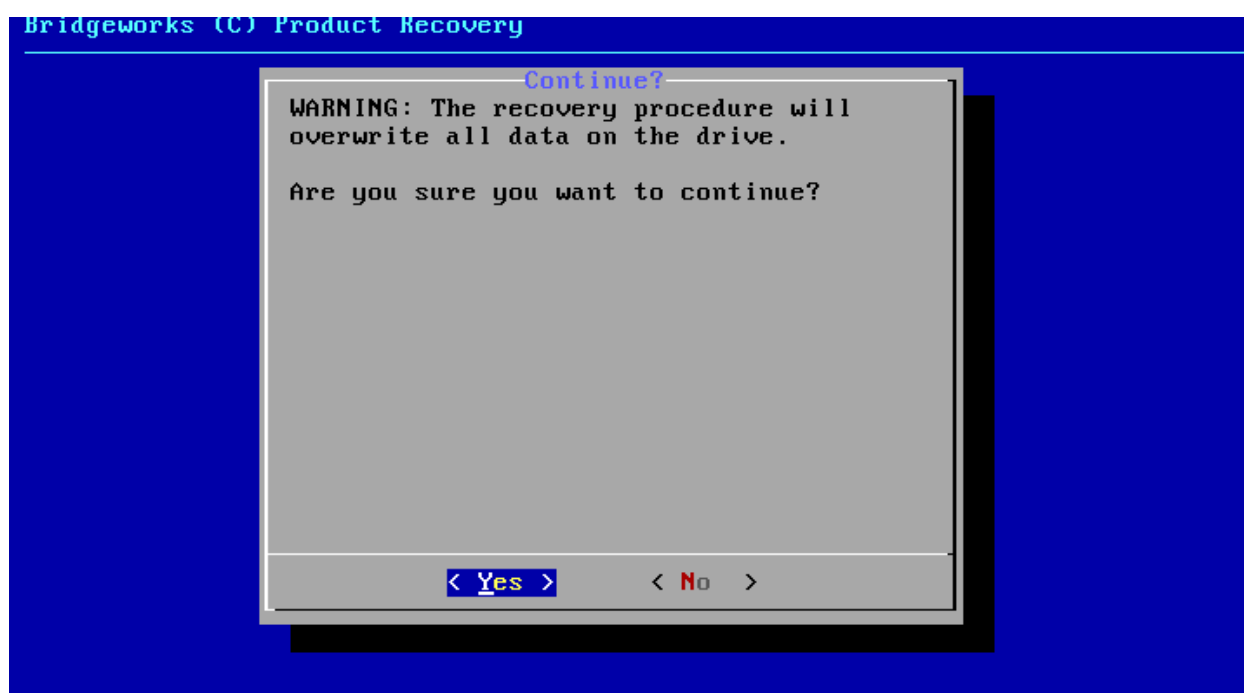

14.5.1 Factory Restore

This option will restore your unit to its factory defaults, removing any current configuration on your system including your current firmware and licence keys.

To restore your unit to defaults, ensure that the *Factory Restore* option is highlighted in the Recovery Wizard menu and press the *Space Bar* to select it. Press the *Enter* key to start the factory restore process.

This procedure cannot be undone once complete; only continue if you are sure that you wish to do so. You will be asked to confirm that you wish to proceed. Choosing Yes will restore your unit to defaults and No will exit the Recovery Wizard menu and drop to the shell.

Once the factory restore procedure has completed successfully you will need to reboot your system.

14.5.2 Delete Configuration

This option will delete your configuration file, removing any current configuration on your system but keeping your current firmware and licence keys.

To delete your configuration file, ensure that the *Delete Configuration* option is highlighted in the Recovery Wizard menu and press the *Space Bar* to select it. Press the *Enter* key to start the deletion process.

This procedure cannot be undone once complete; only continue if you are sure that you wish

to do so. You will be asked to confirm that you wish to proceed. Choosing Yes will delete your configuration file and No will cancel the configuration deletion wizard.

If you cancel the deletion wizard at this point nothing on your system will be affected.

Once the delete configuration procedure has completed successfully you will need to reboot your system.

Bridgeworks (C) Product Recovery

When the Recovery Wizard completes and you connect to the web interface of your unit, it will be reset to its original configuration. For help re-establishing your setup see [Section 2.2: Connecting to the Web Interface](#).

A IP Protocols and Port Numbers

For the Node to be able to communicate with other network hosts, it may be necessary to contact your network administrator to ensure that the required IP protocols & port numbers are available.

A.1 Inbound LAN Protocols and Port Numbers

Protocol/Port	Name	Description
TCP 22	SSH	Required to access the configuration console through management interfaces when SSH is enabled. See Section 3.2.5: Secure Shell (SSH) .
TCP 80	HTTP	Required to access the web interface through management interfaces when HTTP is enabled.
TCP 443	HTTPS	Required to access the web interface through management interfaces when HTTPS is enabled.
TCP 860/3260	iSCSI	The iSCSI Target can be configured to use one or both ports. See Chapter 10: iSCSI Target Configuration .
TCP 8002-8252		Required to access the remote web interface using Remote Control when HTTP is enabled on the controlling Node. One port is needed per Node being controlled remotely, with 8002 being the starting port, increasing incrementally with each Node added. See Section 4.2.7: Remote Control .
TCP 8082		Required to access the remote web interface using Remote Control when HTTPS is enabled on the controlling Node.
UDP 161	SNMP	Required for management interfaces to respond to Simple Network Management Protocol requests, see Section 3.3.2: Simple Network Management Protocol (SNMP) .

A.2 Outbound LAN Protocols and Port Numbers

Protocol/Port	Name	Description
TCP 25	SMTP	Simple Mail Transfer Protocol, see Section 3.3.3: Email .
TCP 3205	iSNS	Internet Storage Name Service protocol, see Section 3.3.5: Internet Storage Name Service (iSNS) .
UDP 123	NTP	Network Time Protocol, see Section 3.3.1: Network Time Protocol (NTP) .
ICMP		Internet Control Message Protocol. Required by dead gateway detection (see Section 3.1.2.5: Dead Gateway Detection) and network debugging tools (see Section 3.1.5: Network Tools).

Note: The iSCSI Initiator uses TCP port 3260 by default, but may use any TCP port specified during target discovery. See Section [9.1: Discovering an iSCSI Target](#).

A.3 WAN Protocols and Port Numbers

Protocol/Port	Name	Description
TCP 16665	axon-tunnel	Reliable multipath data transport for high latencies
UDP 4500	ipsec-nat-t	IPsec NAT-Traversal
UDP 500	isakmp	Internet Security Association and Key Management Protocol
ESP		IP Encapsulating Security Payload

Note: Only TCP Port 16665 is required if not using IPsec encryption or VPN functionality on the PORTrockIT product.

B Accessing the Node from Windows using a static IP Address

This appendix describes how to configure a Windows host to access the Node's web interface from its default static IP address, if DHCP is not enabled on the Node.

These instructions apply to Windows Vista, 7, 8, 10 and to Windows Server 2008, 2012, 2016, and their respective R2 versions.

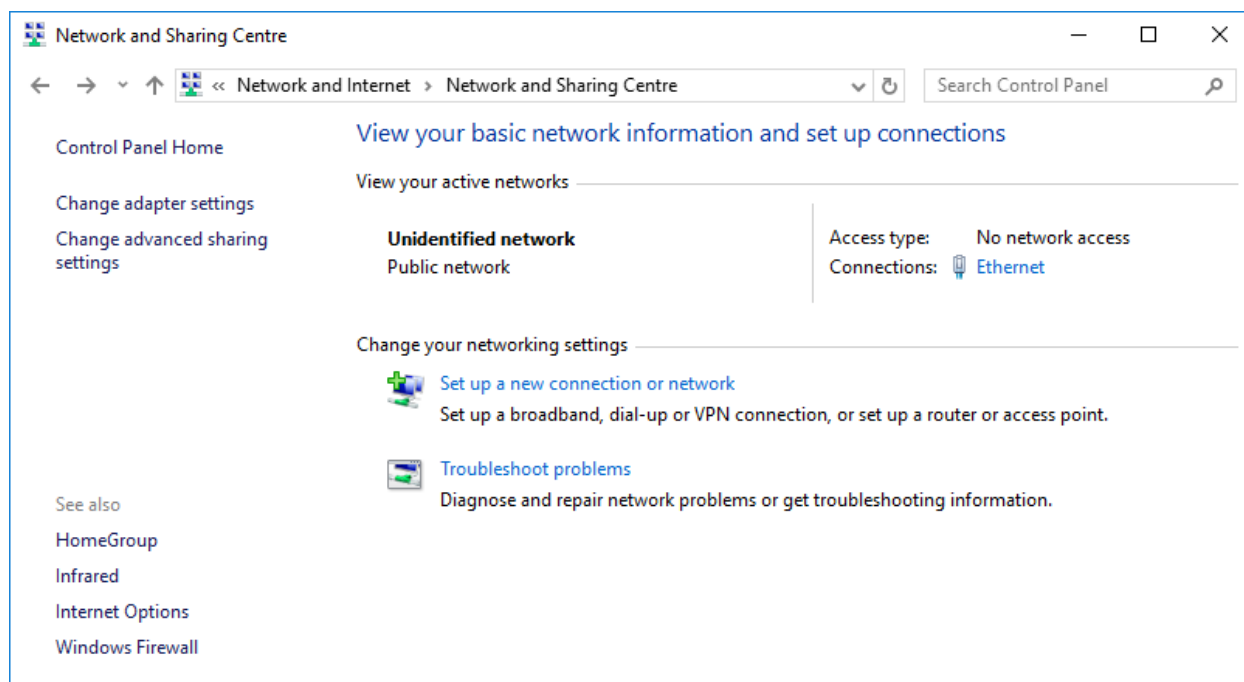

Warning: Administrative privileges may be required to modify network device settings.

From the Start menu, select *Control Panel*.

Important: It may be required to search for "Control Panel" in the Start menu before it appears as an entry.

From the Control Panel select the *Network and Internet* link, followed by the *Network and Sharing Centre* link. Click on the link next to "Connections" for your respective network. This is named "Ethernet" in the screenshot below.

A general status page will be displayed. From within this page select *Properties*.

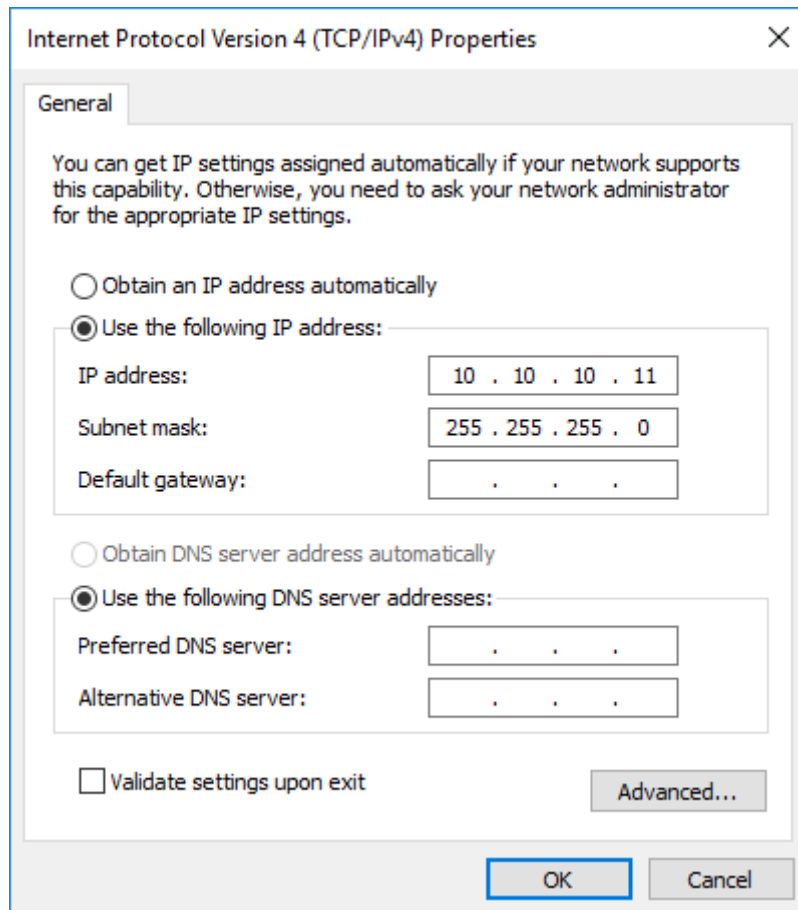

Select the *Internet Protocol Version 4 (TCP/IPv4)* entry and then *Properties*.

Before continuing, make a note of your current configuration as it will be modified. Afterwards,

1. Click *Use the following IP Address*.
2. Enter *10.10.10.11* into the *IP Address* field.
3. Enter *255.255.255.0* into the *Subnet Mask* field.
4. Finally click the *OK* button.

Internet Protocol Version 4 (TCP/IPv4) Properties

General

You can get IP settings assigned automatically if your network supports this capability. Otherwise, you need to ask your network administrator for the appropriate IP settings.

☐ Obtain an IP address automatically

☒ Use the following IP address:

IP address: 10 . 10 . 10 . 11

Subnet mask: 255 . 255 . 255 . 0

Default gateway: . . .

☐ Obtain DNS server address automatically

☒ Use the following DNS server addresses:

Preferred DNS server: . . .

Alternative DNS server: . . .

☐ Validate settings upon exit

Advanced...

OK Cancel

Note: Once you have completed the initial set up of the Node, return your computer to the original settings and reconnect to the Node.

C Connecting to an iSCSI Device using the Microsoft iSCSI Initiator

There are many iSCSI Initiators available. However, for the purpose of this user guide we shall concentrate only on the Microsoft iSCSI Initiator. In this example we have used the Microsoft iSCSI Initiator that is available with Microsoft Vista. However, the following procedure is very similar for all versions of Microsoft iSCSI Initiator.

C.1 General Set up

Open the iSCSI initiator and then click on the *General* tab. You should see the following page:

From this page, you are able to configure the initiator name, specify the initiator secret and set up the IPsec connections. For the purpose of this document we shall leave the initiator name as the default.

If you intend to use Mutual CHAP authentication you must enter the Initiator secret from this page.

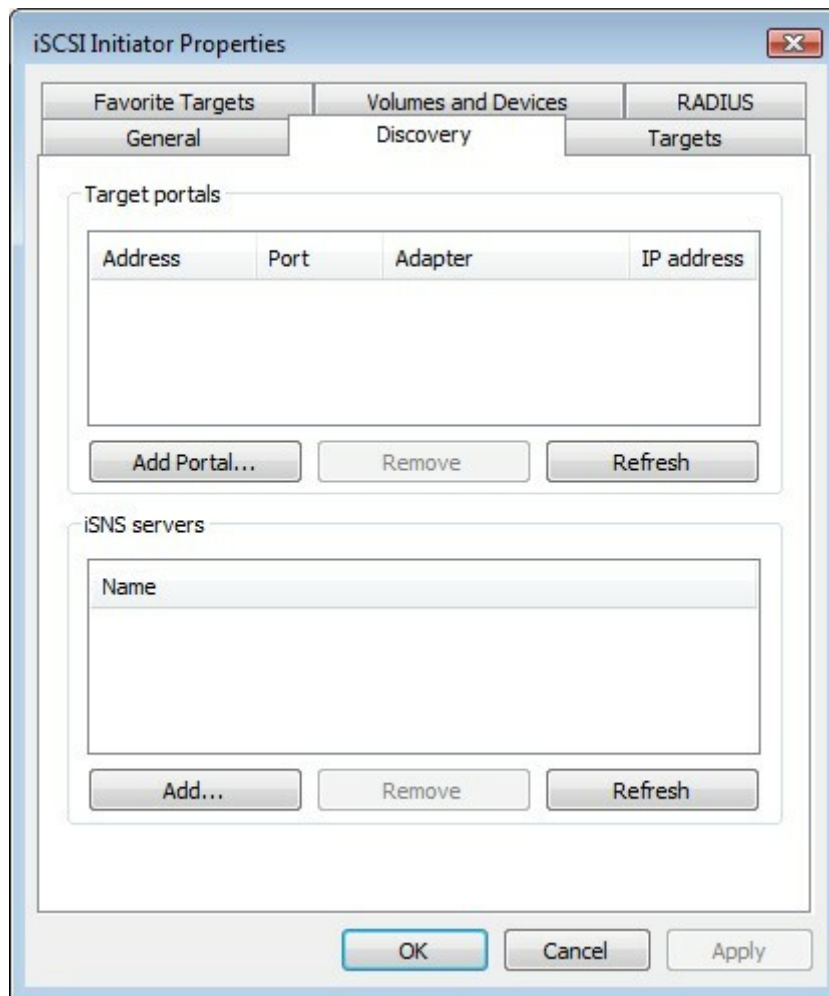

Click on the *Secret* button and the following window should be displayed:

Enter in the CHAP (Initiator) Secret and click OK. The secret should be between 12 and 16 characters. Make a note of this secret as you will need to enter this as part of configuring CHAP on the iSCSI Node.

C.2 Discovery of Devices

Before you can connect to an iSCSI Target, the iSCSI targets must be discovered. Click on the *Discovery* tab and you should see the following page:

Devices can be discovered in one of two ways:

- Adding an iSCSI target portal and directly performing a discovery;
- Adding an iSNS server to which the target portal is registered.

C.2.1 Adding an iSCSI Target Portal

To add an iSCSI Target portal, click on *Add Portal*. You should now be presented with the following window:

Enter the IP address for the iSCSI Target. In this example we shall use the IP address 10.10.10.50.

Leave the port at 3260 unless you have configured your iSCSI Node to only respond on port 860, in which case change it to 860. Click on the *Advanced* button to see the advanced options.

Advanced Settings

General **IPsec**

Connect by using

Local adapter: Microsoft iSCSI Initiator

Source IP: Default

Target portal:

CRC / Checksum

☐ Data digest ☐ Header digest

☐ CHAP logon information

CHAP helps ensure data security by providing authentication between a target and an initiator. To use it, specify the same target CHAP secret that was configured on the target for this initiator.

User name: iqn.1991-05.com.microsoft:tarquin-vista

Target secret:

☐ Use RADIUS to generate user authentication credentials

☐ Perform mutual authentication

To use mutual CHAP either specify an initiator secret on the Initiator Settings page or use RADIUS. The same secret must be configured on the target.

☐ Use RADIUS to authenticate target credentials

OK Cancel Apply

The *Connect by using* section allows you to specify which iSCSI adapter to use and the Source IP. The *Local adapter* should only differ from Microsoft iSCSI Initiator if an iSCSI offload card has been installed. For the purpose of this guide, we shall only use the Microsoft iSCSI Initiator. Leaving this setting as *Default* will also use the Microsoft iSCSI Initiator.

The *Source IP* is used to specify upon which network adapter the discovery will be done. In most cases you will want to leave this as default. If multiple network interfaces are installed in the Server and you wish to select a particular interface, select the IP address of that network interface from the drop down list.

Note: You may need to select a specific local adapter in order to choose certain source IP addresses.

CRC/Checksum settings allow you to specify whether the discovery is done using Data and/or Header Digests. Unless the iSCSI device is on a poor quality network where data corruption is likely, it is recommended that Header and Data Digests are left disabled, as performance will be

affected.

If the iSCSI Node has CHAP enabled, or you wish to authenticate the iSCSI Node, click on the checkbox *CHAP logon information* to enable CHAP. Now enter the username and target secret that are configured on the iSCSI Node. If you wish to authenticate the iSCSI Node, select *Perform mutual authentication*.

Note: For mutual CHAP to be performed, the *Initiator Secret* must be set on the general tab, and be the same as the one configured on the iSCSI Node.

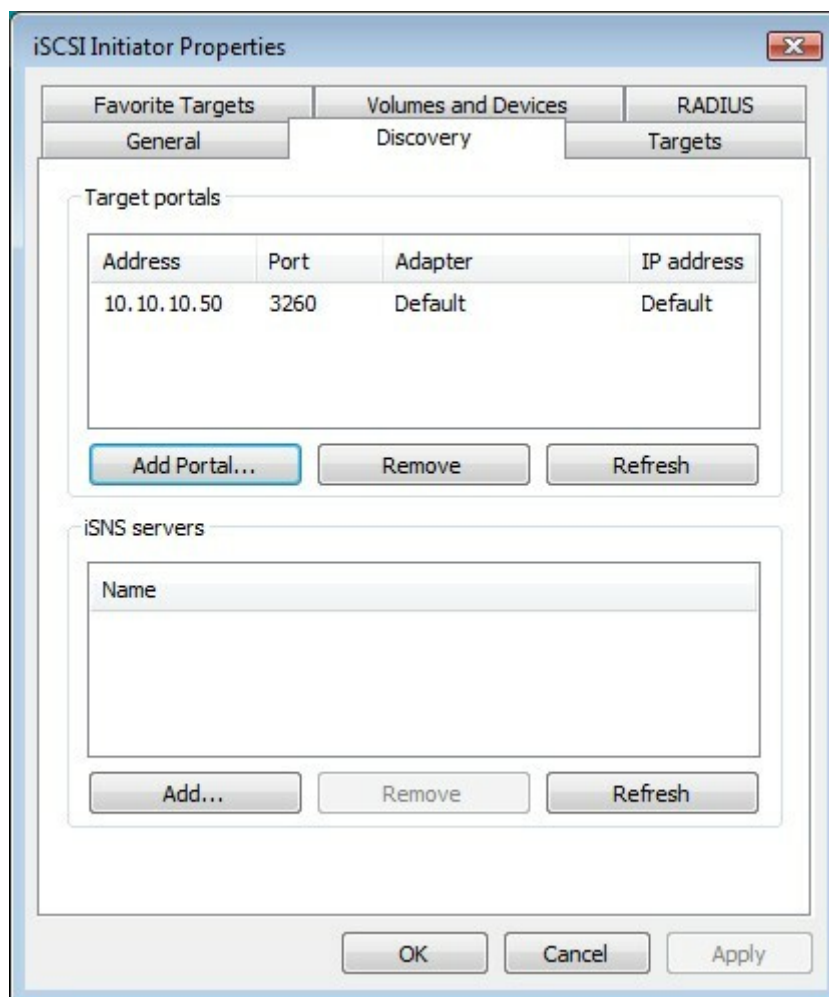

Note: The use of RADIUS is beyond the scope of this guide.

Once you are satisfied that all advanced options are correct, click OK.

Now click OK in the *Add Target Portal* window, and the Microsoft iSCSI Initiator shall perform the discovery. This is usually a quick process, but can take up to a minute with multiple network ports.

Once the discovery is complete, you should see the target listed in the *Target Portals* list:

C.2.2 Adding an iSNS Server

To discover iSCSI targets using this method, your iSCSI Node must be registered with your designated iSNS server. See [Section 3.3.5: Internet Storage Name Service \(iSNS\)](#) for more information.

Under *iSNS servers*, click *Add*. The following window should appear:

Enter the address of the iSNS server with which your iSCSI Node is registered, then click *OK*. The Microsoft iSCSI Initiator will now query the iSNS server and perform discoveries on registered target portals.

Click on the *Targets* tab. The discovered devices should now be listed.

In this example two iSCSI targets have been discovered. The first device is the tape drive, and the

second is the media changer. If no devices are displayed, check that the settings used to perform the discovery, including CHAP settings, are correct. Then return to *Targets* tab and click *Refresh*.

If still no devices are displayed, check network cables and that the iSCSI Node is operational.

C.3 Connecting to a Target

To connect to one of the displayed iSCSI targets, click on its list entry, then click the *Log on* button. In this example we have chosen the first target. The following window should appear:

If you wish to reconnect to the target automatically when this Windows server reboots, select the *Automatically restore this connection when the computer starts* checkbox.

Click on the *Advanced* button to see the advanced settings. The following window should appear:

Advanced Settings

General IPsec

Connect by using

Local adapter: Microsoft iSCSI Initiator

Source IP: 10.0.0.237

Target portal: 10.10.10.50 / 3260

CRC / Checksum

☐ Data digest ☐ Header digest

☐ CHAP logon information

CHAP helps ensure data security by providing authentication between a target and an initiator. To use it, specify the same target CHAP secret that was configured on the target for this initiator.

User name: iqn.1991-05.com.microsoft:tarquin-vista

Target secret:

☐ Use RADIUS to generate user authentication credentials

☐ Perform mutual authentication

To use mutual CHAP either specify an initiator secret on the Initiator Settings page or use RADIUS. The same secret must be configured on the target.

☐ Use RADIUS to authenticate target credentials

OK Cancel Apply

The Advanced Settings page is the same as that of the discovery except for one addition. In the *Connect by using* section, there is a *Target portal* option. This allows you to choose which interface of the iSCSI Node will be used to make the connection to the target. In this example we have chosen to connect to the IP address 10.10.10.50 on port 3260.

To see how this relates to the iSCSI Node configuration, note the IP addresses in the Network Interfaces subsection, on the iSCSI Target page of the iSCSI Node's web interface:

iSCSI Target

Hostname

- [Home](#)
- [Reboot](#)
- [Logout](#)
- [Support](#)
- [Help](#)

Authorisation

! While secrets longer than 16 characters are allowed, they may be unsupported by some hosts.

Enable CHAP: ☐

Username:

Initiator Secret:

Target Secret:

Network Interfaces

Interface	Configured TCP Port(s)
Port 2 (10.10.10.87):	3260 ▼

Cancel
Save

See Chapter [10: iSCSI Target Configuration](#) for more information.

Important: If you wish to connect to a target over multiple network interfaces, see Appendix [C.5: Creating Multiple Connections \(Optional\)](#). For now, select the *Source IP* and *Target portal* for the first connection to the target.

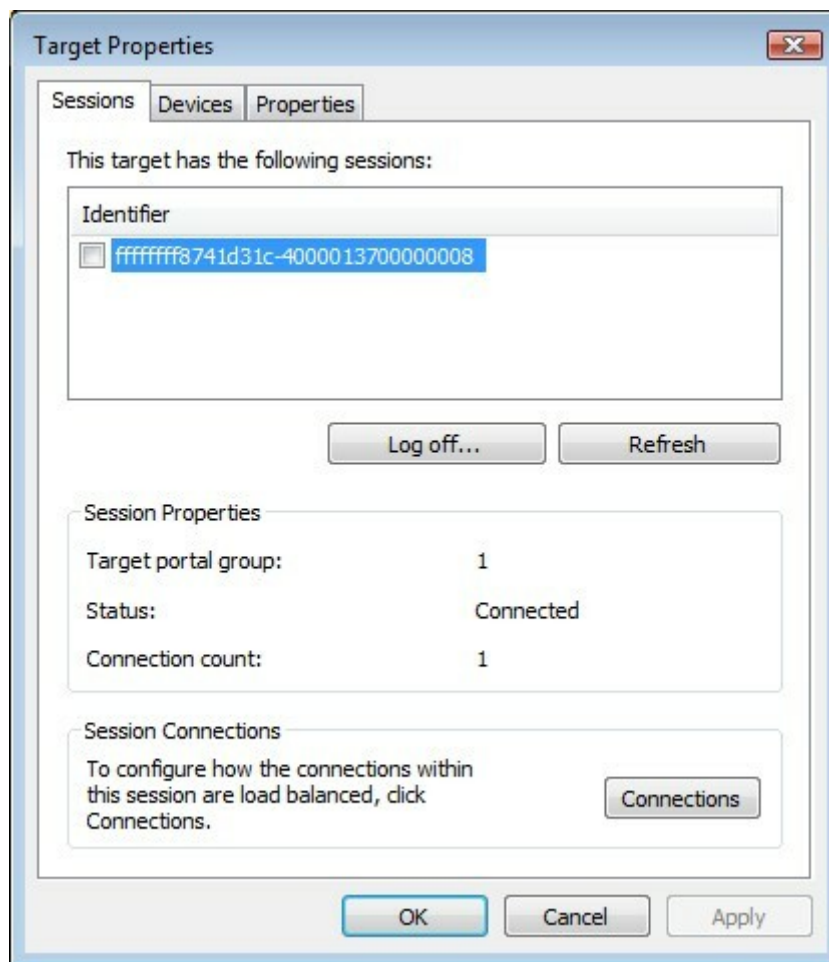

To set up the Digest and CHAP settings, see Appendix [C.2: Discovery of Devices](#).

The list entry for the target should now display *Connected* in the *Status* column:

C.4 Viewing iSCSI Session Details

When you have connected to an iSCSI Target, you can check that the device is connected by clicking on the *Details* button. The following window will appear:

In this window you can view the iSCSI Sessions associated to the iSCSI Target, how many connections are attached to each iSCSI Session, and the Target Portal Group.

If you click on the *Device tab*, details of the target device will be displayed. Here for example, we can see that the device is an IBM LTO Tape drive.

C.5 Creating Multiple Connections (Optional)

If you wish to create multiple connections to an iSCSI target, it is recommended to use Multiple Connections per Session ("MCS") rather than creating multiple sessions ("MPIO"). This subsection will only cover the procedure for MCS.

Navigate the *Target Properties* window, by selecting the target from the *Targets* list and clicking *Details* if necessary. Navigate to the *Sessions* tab.

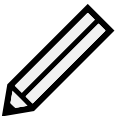

Click on the *Connections* button to open the *Session Connections* window:

This shows how many iSCSI Connections are active and the type of load balance used. For all iSCSI Sessions, there will be at least one leading connection.

iSCSI connections can be added and removed at any time, all apart from the leading connection, which can only be removed when the iSCSI Session is logged off.

Note: The *Load balance policy* specifies how the data is distributed over multiple connections. The main policies that should be used are *Round Robin* and *Fail Over Only*:

Round Robin will utilize all connections for data and evenly distribute the data.

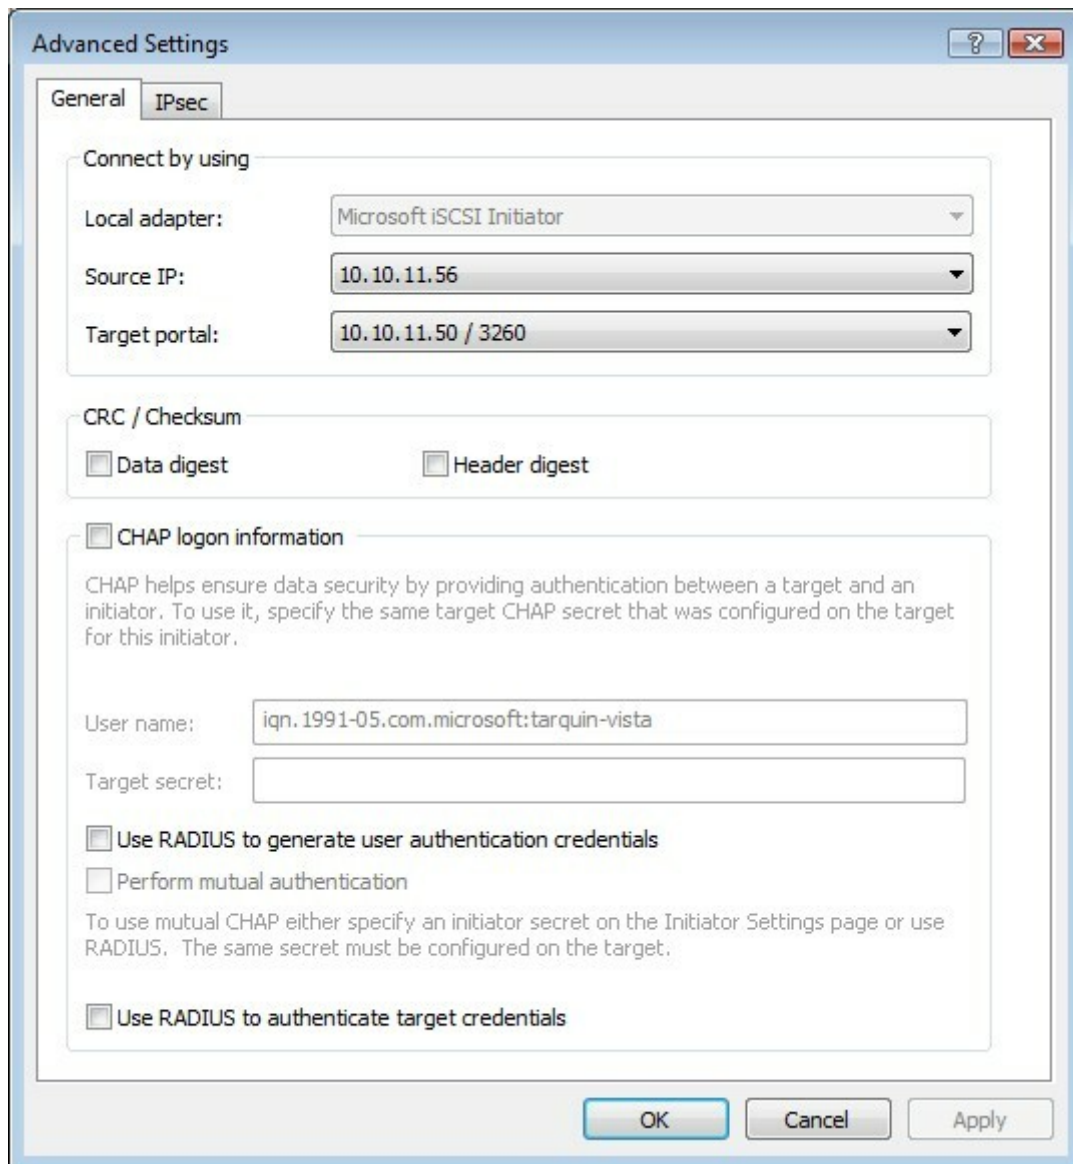

Fail Over Only will use the leading connection for data transfer. If a connection should go down then the data transfer shall switch to one of the other connections.

For most purposes, *Round Robin* will provide the best performance.

To add a new connection to a session, click on the *Add* button to open the following window:

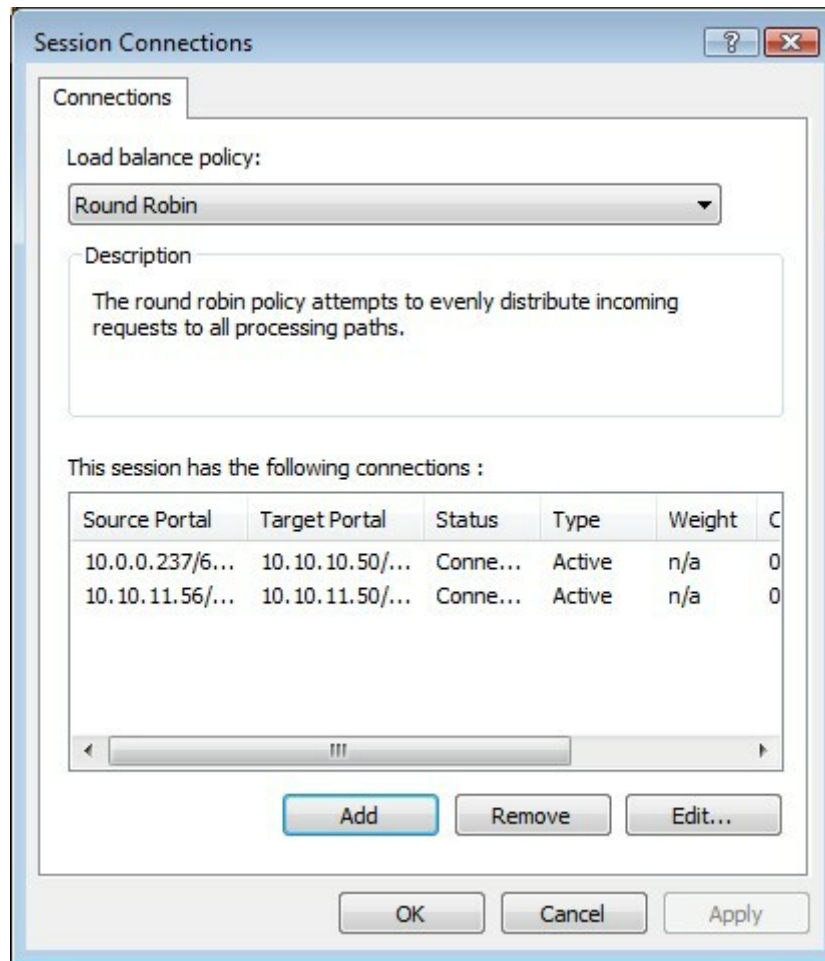

Then click *Advanced* to open *Advanced Settings*:

In the *Connect by using* section, select the *Source IP* address and the *Target portal* address for the new connection. In most instances these should be different from the source and target addresses of the original connection. In this example we have connected to 10.10.10.50 / 3260 as the leading connection, and the second connection will be 10.10.11.50 / 3260.

Configure CHAP and Header/Data Digest, and click OK. Then, click OK within the *Add Connection*

window and now you should see the new, additional connection listed in the *Session Connections* window.

Note: Up to 8 connections can be added to one session.

Once you have completed setting up the connections, click OK to return to the *Target Properties* page. Under *Session Properties*, you will see that the *Connection count* field value has increased:

Now click on OK to return to the Microsoft iSCSI Initiator main window.

Important: If you have been experiencing a performance decrease when transferring data to more than one device using multiple connections, please refer to Chapter 14: [Troubleshooting](#).

C.6 Logging off an iSCSI Session

To log off an iSCSI Session, follow the following procedure.

1. Open the Microsoft iSCSI Initiator and click on the *Targets* tab.
2. Click on the iSCSI session that you wish to log off and then click *Details*.
3. In the *Target Properties* window, select the *Sessions Tab* and select the identifier that is to be logged off.
4. Click the *Log off* button. This will log off all connections associated with the iSCSI Session.
5. The session identifier should now be removed from the identifier list. Click OK to return to the main iSCSI Initiator window.

The iSCSI device should now show as inactive.

D Connecting to an iSCSI Device using iscsiadm

Important: The `iscsiadm` command may require root privileges to function. This guide will assume that the user has root privileges.

D.1 Discovering iSCSI Targets

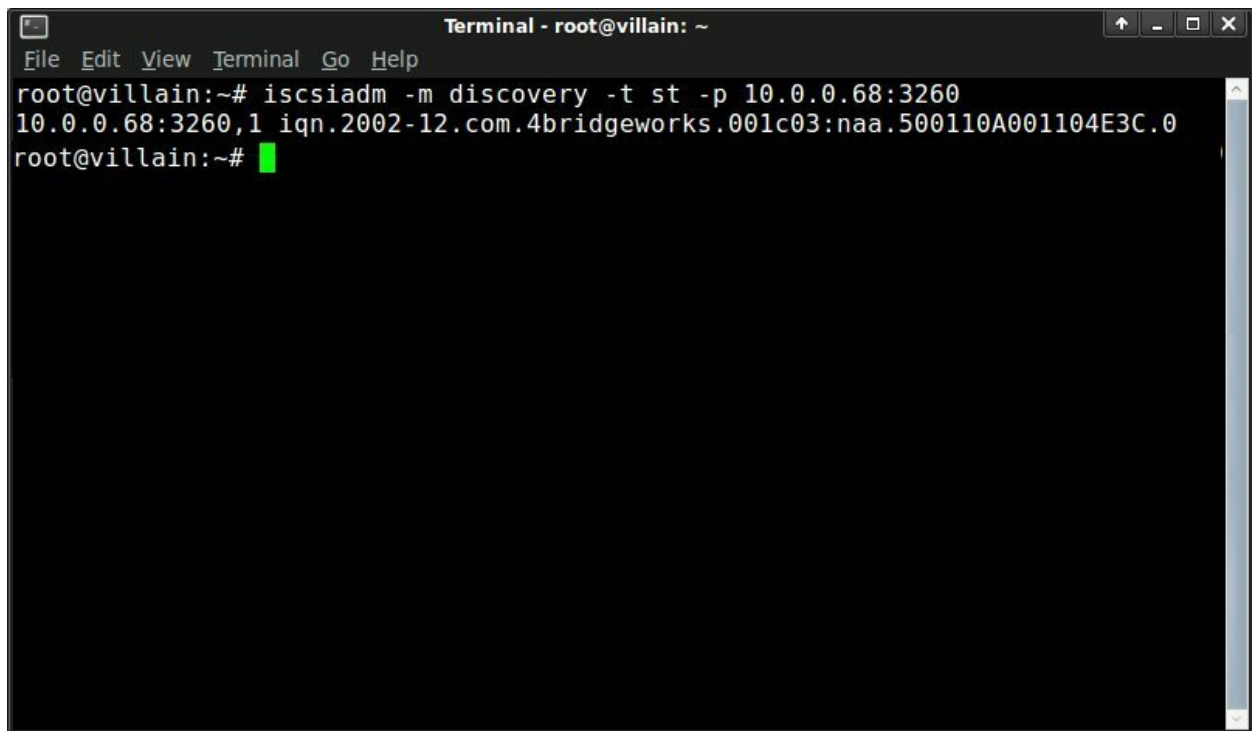

To get a list of available targets on the Node, run a discovery using the following command:

```
iscsiadm -m discovery -t st -p <Target IP Address>:<Port Number>
```

An example of this is shown below when performing a discovery on a target with the IP address 10.0.0.68 on port 3260.

```
Terminal - root@villain: ~
File Edit View Terminal Go Help
root@villain:~# iscsiadm -m discovery -t st -p 10.0.0.68:3260
```

When the command is run, you should see a list of available targets as shown below:

A terminal window titled "Terminal - root@villain: ~" with a menu bar (File, Edit, View, Terminal, Go, Help) and window controls. The terminal shows the command `iscsiadm -m discovery -t st -p 10.0.0.68:3260` and its output: `10.0.0.68:3260,1 iqn.2002-12.com.4bridgeworks.001c03:naa.500110A001104E3C.0`. The prompt `root@villain:~#` is followed by a green cursor.

```
Terminal - root@villain: ~
File Edit View Terminal Go Help
root@villain:~# iscsiadm -m discovery -t st -p 10.0.0.68:3260
10.0.0.68:3260,1 iqn.2002-12.com.4bridgeworks.001c03:naa.500110A001104E3C.0
root@villain:~#
```

D.2 Logging into a target

Once you have discovered the available targets, you can then login to the target. The following command will allow you to login to an individual target:

```
iscsiadm -m node -T <Complete Target Name> -I -p <Target IP Address>:<Port Number>
```

The example below shows logging into the discovered target

```
iqn.2002-12.com.4bridgeworks.001c03:naa.500110A001104E3C.0:
```

```
Terminal - root@villain: ~
File Edit View Terminal Go Help
root@villain:~# iscsiadm -m node -l -T iqn.2002-12.com.4bridgeworks.001c03:naa.500110A001104E3C.0 -l -p 10.0.0.68:3260
```

When you have successfully logged in to the target device, the screen should update as shown below:

```
Terminal - root@villain: ~
File Edit View Terminal Go Help
root@villain:~# iscsiadm -m node -l -T iqn.2002-12.com.4bridgeworks.001c03:naa.500110A001104E3C.0 -l -p 10.0.0.68:3260
Logging in to [iface: default, target: iqn.2002-12.com.4bridgeworks.001c03:naa.500110A001104E3C.0, portal: 10.0.0.68,3260]
Login to [iface: default, target: iqn.2002-12.com.4bridgeworks.001c03:naa.500110A001104E3C.0, portal: 10.0.0.68,3260]: successful
root@villain:~#
```

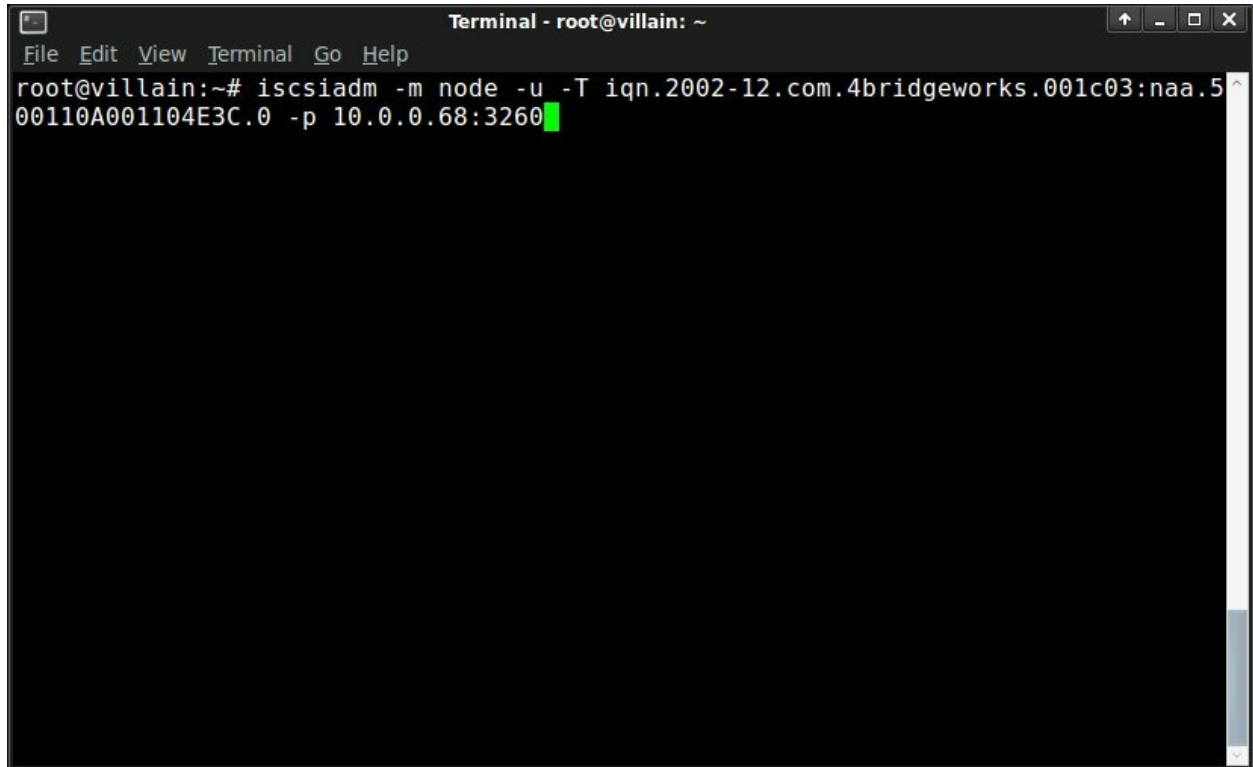

To login to all targets found, the following command can be used:

```
iscsiadm -m node -l
```

D.3 Logging out of a target

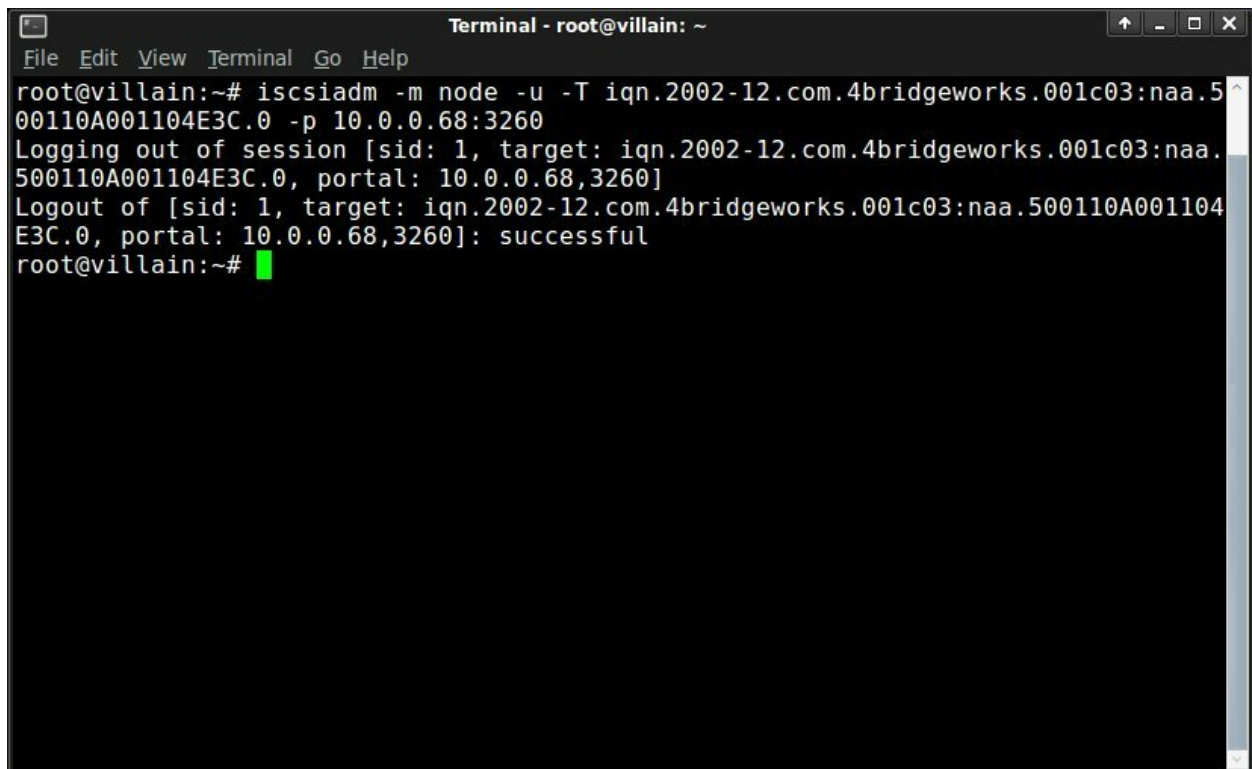

To log out of an individual target enter the following command at the prompt:

```
iscsiadm -m node -u -T <Complete Target Name> -p <Target IP Address>:<Port Number>
```

A terminal window titled "Terminal - root@villain: ~" with a menu bar (File, Edit, View, Terminal, Go, Help) and window controls. The prompt is "root@villain:~#". The command entered is "iscsiadm -m node -u -T iqn.2002-12.com.4bridgeworks.001c03:naa.500110A001104E3C.0 -p 10.0.0.68:3260". A green cursor is at the end of the command.

```
root@villain:~# iscsiadm -m node -u -T iqn.2002-12.com.4bridgeworks.001c03:naa.500110A001104E3C.0 -p 10.0.0.68:3260
```

When you have successfully logged out of the target device, the screen should update as shown below:

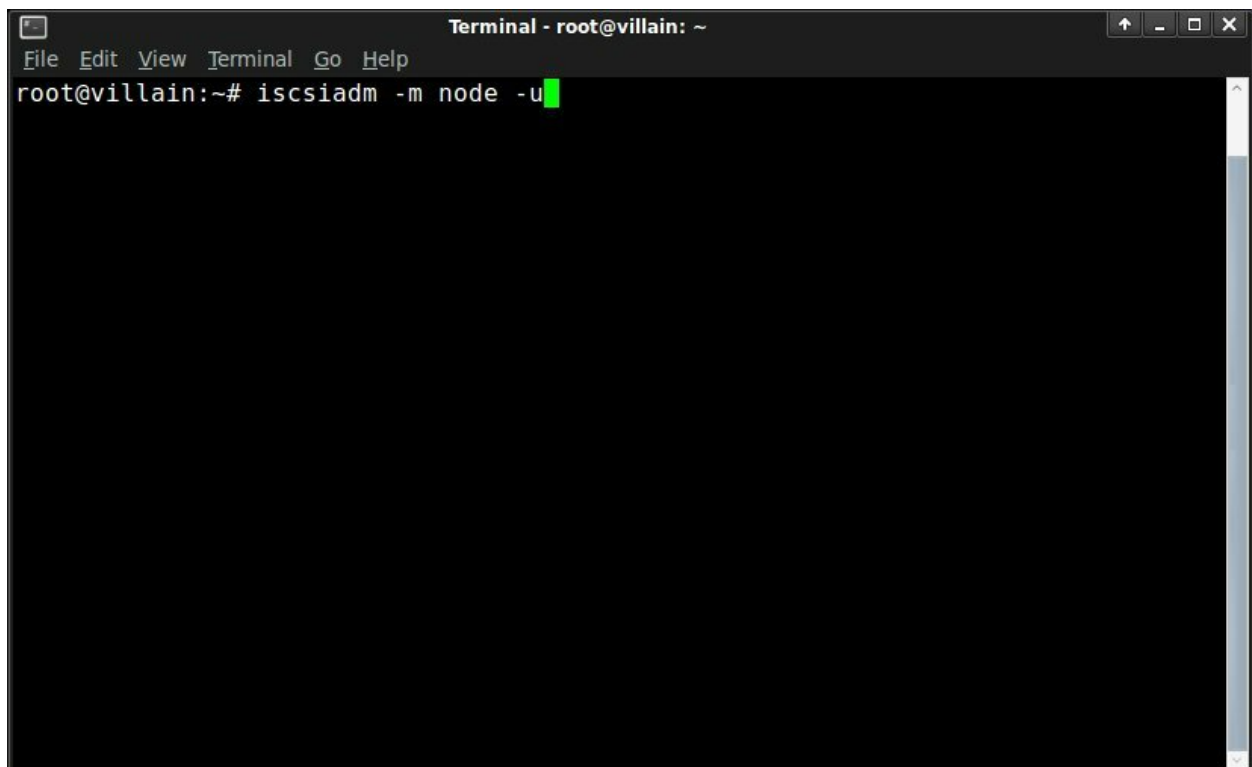

```
Terminal - root@villain: ~
File Edit View Terminal Go Help
root@villain:~# iscsiadm -m node -u -T iqn.2002-12.com.4bridgeworks.001c03:naa.500110A001104E3C.0 -p 10.0.0.68:3260
Logging out of session [sid: 1, target: iqn.2002-12.com.4bridgeworks.001c03:naa.500110A001104E3C.0, portal: 10.0.0.68,3260]
Logout of [sid: 1, target: iqn.2002-12.com.4bridgeworks.001c03:naa.500110A001104E3C.0, portal: 10.0.0.68,3260]: successful
root@villain:~#
```

D.4 Logging out of all targets

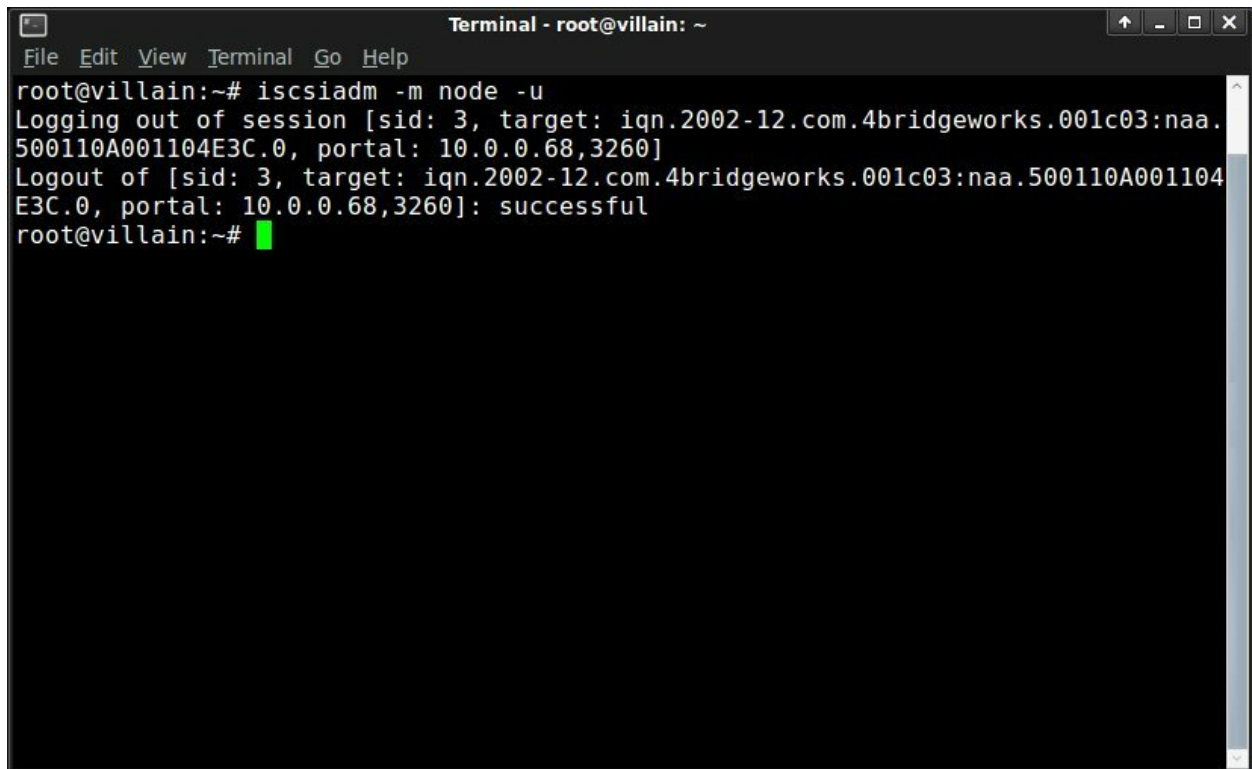

To log out of all targets enter the following command at the prompt:

```
iscsiadm -m node -u
```

```
Terminal - root@villain: ~
File Edit View Terminal Go Help
root@villain:~# iscsiadm -m node -u
```

When you have successfully logged out of the targets, the screen should update as shown below:

```
Terminal - root@villain: ~
File Edit View Terminal Go Help
root@villain:~# iscsiadm -m node -u
Logging out of session [sid: 3, target: iqn.2002-12.com.4bridgeworks.001c03:naa.500110A001104E3C.0, portal: 10.0.0.68,3260]
Logout of [sid: 3, target: iqn.2002-12.com.4bridgeworks.001c03:naa.500110A001104E3C.0, portal: 10.0.0.68,3260]: successful
root@villain:~#
```

E WANrockIT Series Comparisons

E.1 Node Limits

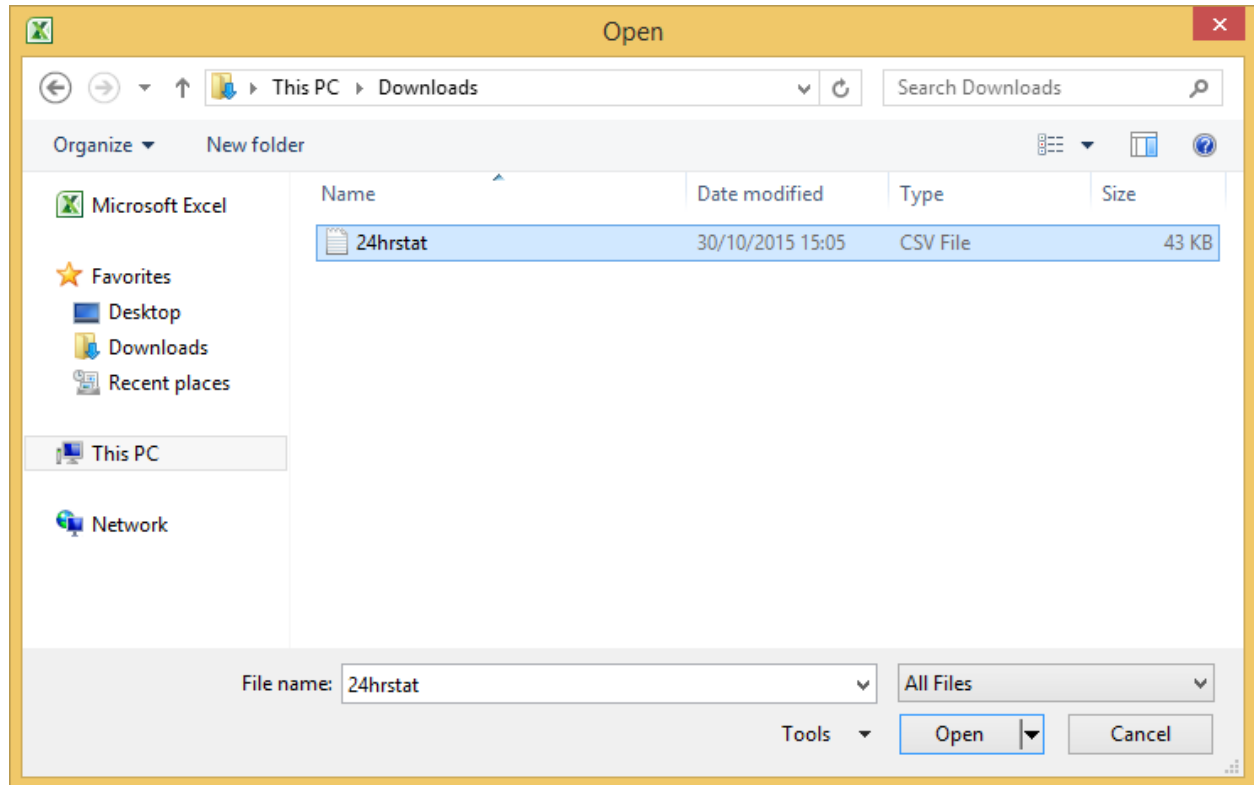

Series	Bandwidth	Maximum Connected Nodes
100	1 Gb/s	1
200	2 Gb/s	4
400	10 Gb/s	10
600	20 Gb/s	20

Bandwidth The bandwidth limit applied to accelerated transfers.

Maximum Connected Nodes The maximum number of Nodes that a Node may connect to.

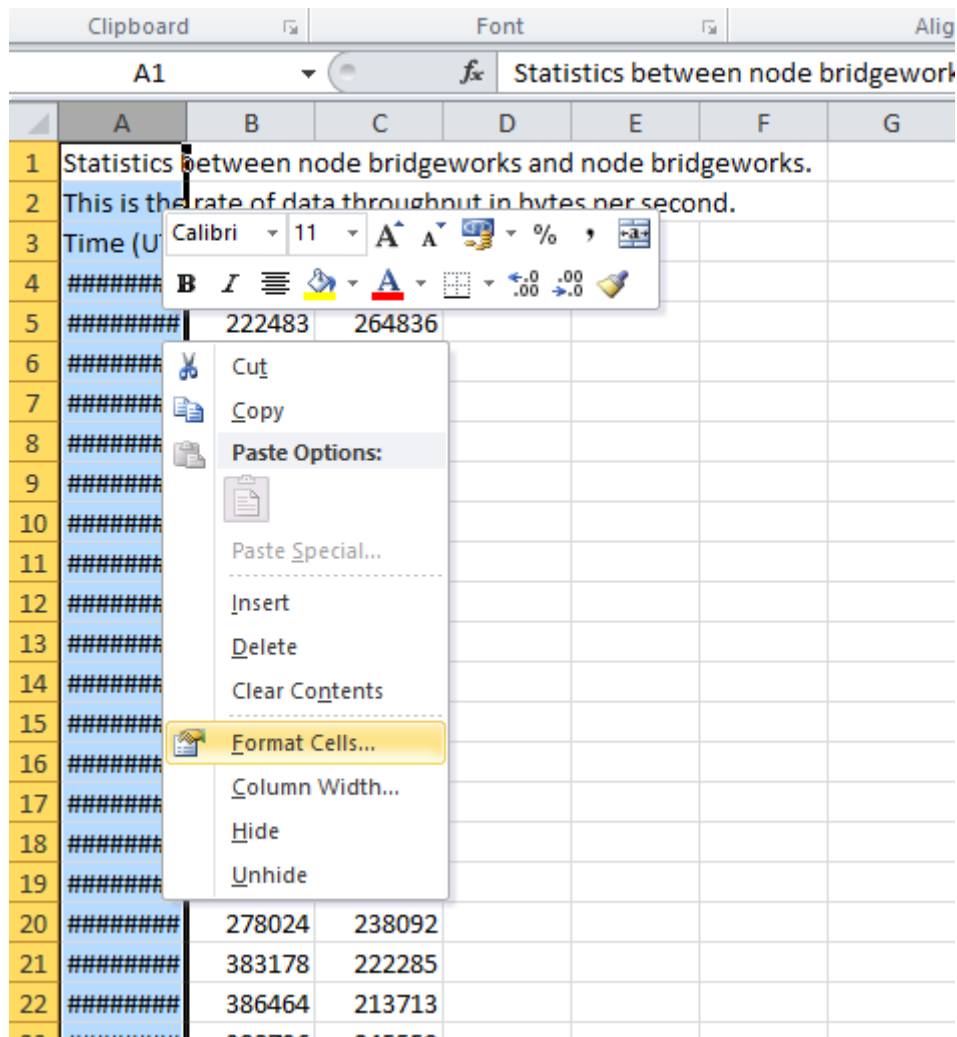

F Transfer Statistics Graphing Instructions for Excel 2010

Open Microsoft Excel 2010. From the *Open* dialog box, navigate to the download location for the transfer statistics. Open the file type drop down box and select the transfer statistics .csv file as shown:

Note: For information on obtaining transfer statistics from your WANrockIT Node, see Section 4.1.3.2: [Download 24 Hour Transfer History](#).

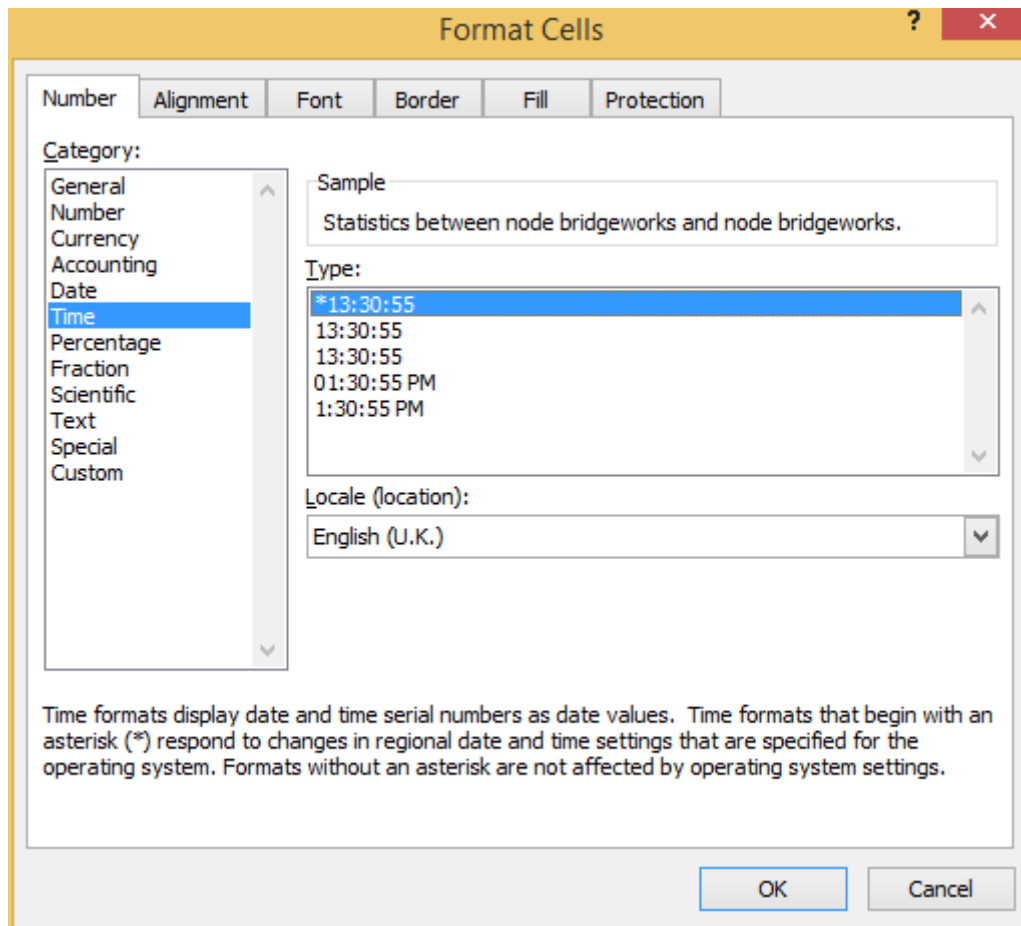

Select the A column of the newly generated worksheet, right-click, and select *Format Cells*.

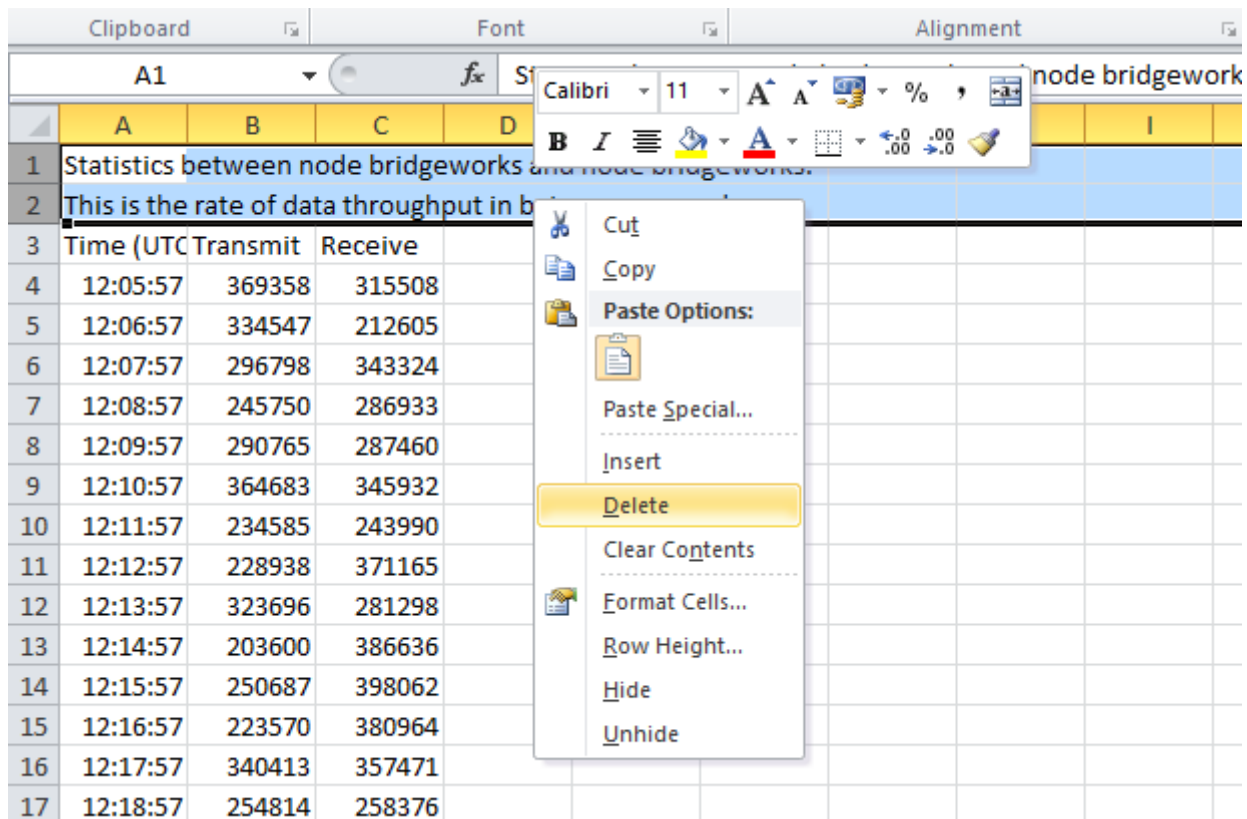

From the *Number* tab, select the *Time* category, and select the option *13:30:55 as shown below then click *OK*.

Note: The time format chosen here is not the format in which the time will be displayed in the final graph.

Select the first two rows (row 1 and row 2) then right-click and select *Delete*.

Select the first column by clicking on A. Then, hold down the **Ctrl** key on the keyboard and select the columns B and C. The three columns should now be selected as shown below:

	A	B	C	D	E	F
1	Time (UTC)	Transmit	Receive			
2	09:23:16	1.41E+08	1.62E+08			
3	09:24:16	1.66E+08	2.06E+08			
4	09:25:16	1.51E+08	1.15E+08			
5	09:26:16	1.43E+08	37955584			
6	09:27:16	1.8E+08	89098240			
7	09:28:16	1.37E+08	49795072			
8	09:29:16	1.52E+08	1.16E+08			
9	09:30:16	1.63E+08	38588416			
10	09:31:16	1.43E+08	1.08E+08			
11	09:32:16	1.58E+08	49329152			
12	09:33:16	1.58E+08	1.69E+08			
13	09:34:16	1.57E+08	1.9E+08			
14	09:35:16	1.5E+08	95232000			
15	09:36:16	1.6E+08	47575040			
16	09:37:16	1.41E+08	62429184			
17	09:38:16	1.69E+08	68653056			
18	09:39:16	1.6E+08	75950080			

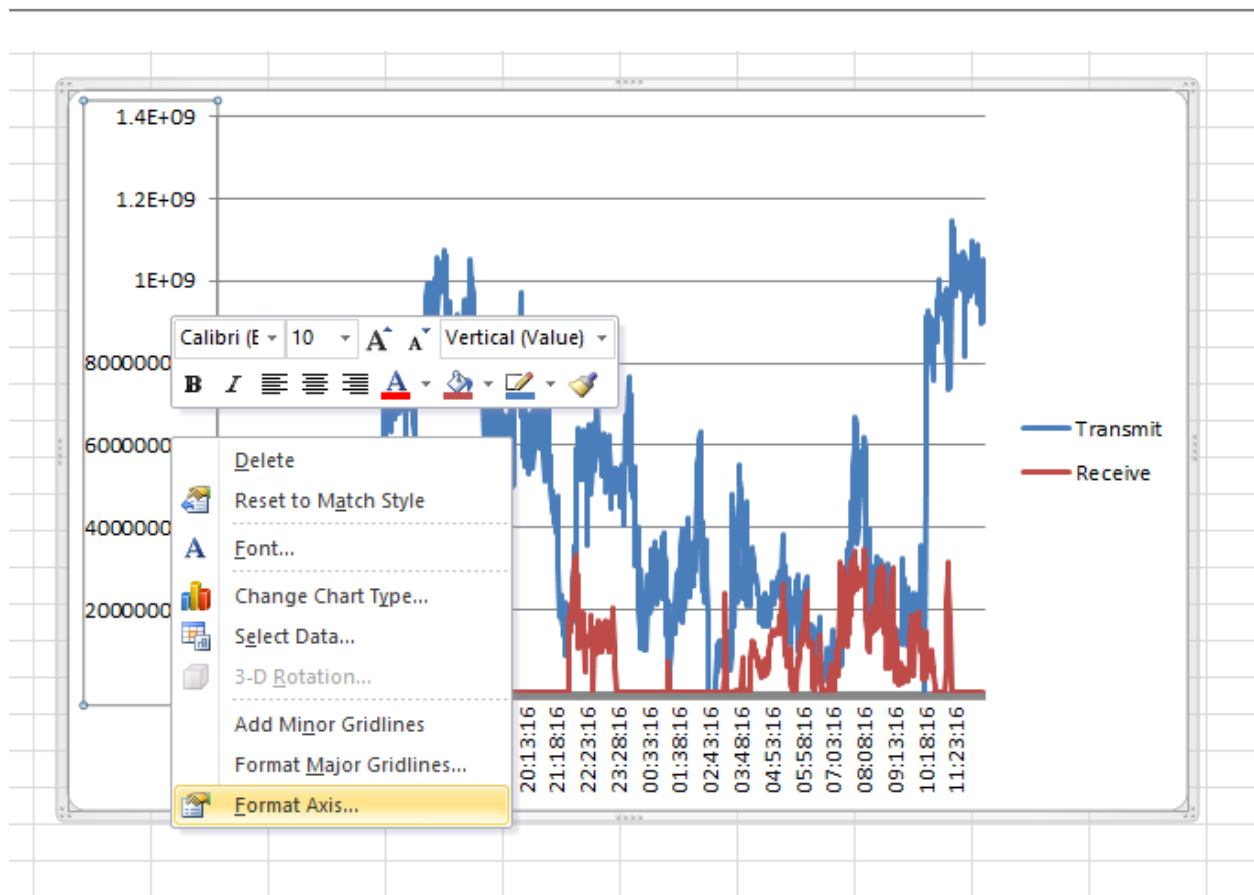

Warning: Selecting all three columns at the same time may cause errors in generating the graph in the following steps. Remember to select column A first and then the other two columns with the **Ctrl** key held down.

On the *Insert* tab, in the *Charts* group, select the *Line* chart type and then the first icon shown.

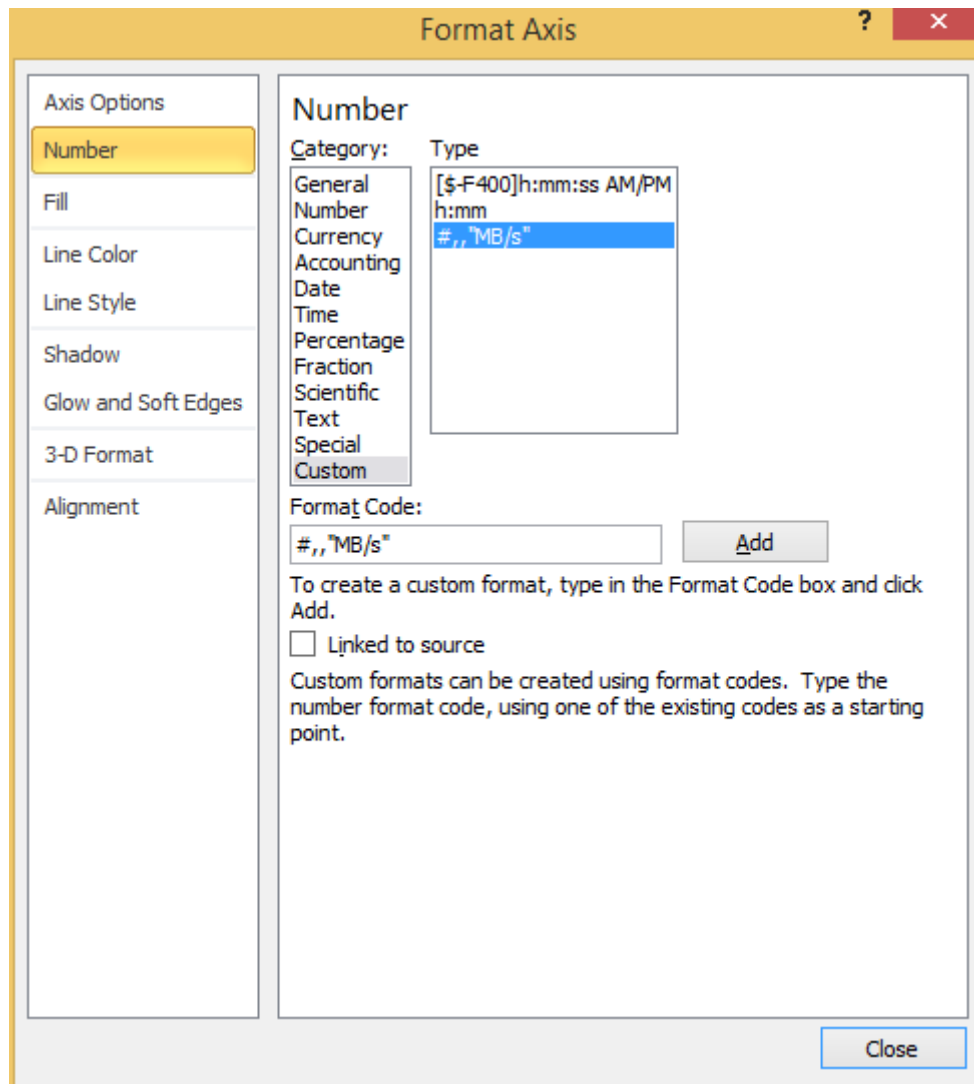

A new chart will be created. Right click the vertical axis on this chart and select *Format Axis*.

From the *Number* tab, select the *Custom* category. Enter the following in the *Format Code* field:

#,,"MB/s"

Click *Add*, then *Close*.

Now right click the horizontal axis and select *Format Axis*.

From the *Number* tab, select the *Time* category. Select the format you wish for the time to be displayed.

Alternatively, you can use a custom format for the date. In this case, select the *Custom* category, and enter your custom format in to the *Format Code* text field. The following is an example of a format code:

m/d/yy h:mm AM/PM

Click *Add* and then *Close*. Your chart should now look like the following:
